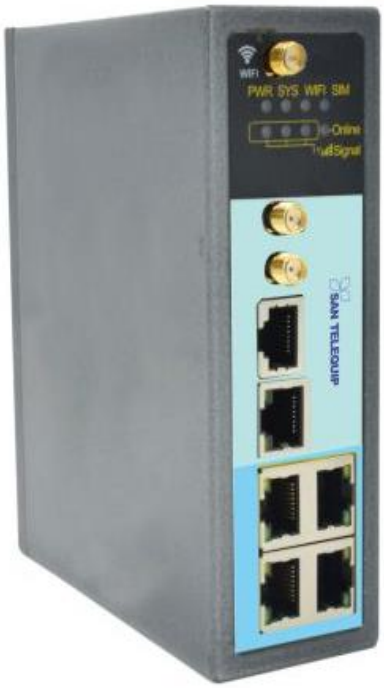
User Manual For
GSF M2M 200R Cellular Gateway



Chapter 1 Brief Introduction of Product

1.1 General

San Telequip Industrial Cellular Gateway GSF M2M-200R is an intelligent 3G/4G Cellular Gateway to provide the necessary M2M applications for all types of terminals.

It adopts a high-powered industrial 32-bits CPU and embedded real time operating system. It supports RS232 (or RS485/RS422), Ethernet and WIFI port that can conveniently and transparently connect one device to a cellular network, allowing you to connect to your existing serial, Ethernet and WIFI devices with only basic configuration.

It has been widely used on M2M fields, such as self-service terminal industry, intelligent transportation, smart grid, smart home, industrial automation, intelligent building, public security, fire protection, environment protection, telemetry, finance, POS, water supply, meteorology, remote sensing, digital medical, military, space exploration, agriculture, forestry, petrochemical and other fields etc.

1.2 Features and Benefits

Design for Industrial Application

- High-powered industrial cellular module
- High-powered industrial 32bits CPU
- Adapt dual SIM design to ensure the stable and reliable of the Cellular Gateway
- Support low-consumption mode, including sleep mode, scheduled online/offline mode, scheduled power-on/power-off mode(optional)
- Housing: iron, providing IP30 protection.
- Power range: DC 5~36V

Stability and Reliability

- Support hardware and software WDT
- Support auto recovery mechanism, including online detect, auto redial when offline to make Cellular Gateway always online
- Ethernet port : 1.5KV Magnetic isolation protection
- RS232/RS485/RS422 port : 15KV ESD protection
- SIM/UIM port : 15KV ESD protection
- Power port: reverse-voltage and over-voltage protection

Standard and Convenience

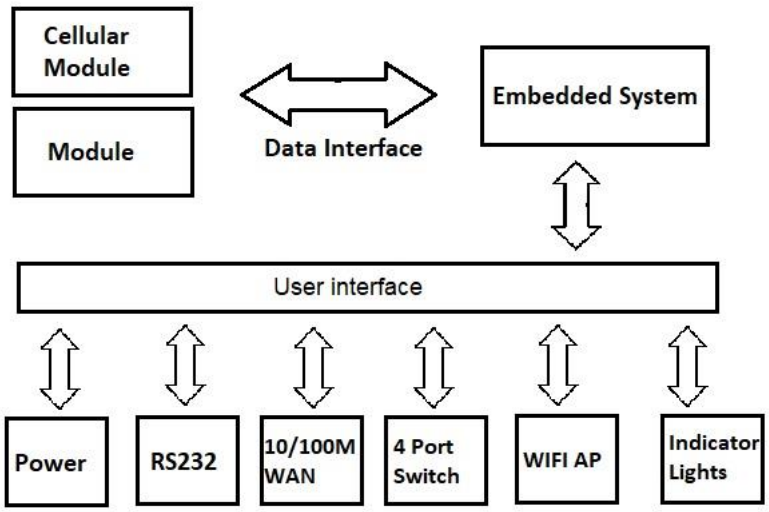
- Support standard RS232(or RS485/RS422), Ethernet and WIFI port that can connect to serial, Ethernet and WIFI devices directly
- Support standard WAN port and PPPOE protocol that can connect to ADSL directly
- Support intellectual mode, enter communication state automatically when powered
- Provide management software for remote management
- Convenient configuration and maintenance interface WEB or CLI)

High-performance

- Dual SIM redundancy for continuous cellular connections supports 2.5G/3G/4G.
- 5 Ethernet ports (4 LAN ports and 1 WAN port).
- (6) pin 3.5mm terminal block.
- Support double link backup between cellular and WAN (PPPOE, ADSL) (optional).
- Support VPN client (PPTP, L2TP, OPENVPN, IPSEC and GRE) (only for VPN version).
- Support VPN server (PPTP, L2TP, OPENVPN, IPSEC and GRE) (only for VPN version).
- Support local and remote firmware upgrade, import and export configure file.
- Support NTP, RTC embedded.
- Support multiple DDNS provider service
- Support VLANs, MAC Address clone, PPPoE Server
- WIFI support 802.11b/g/n. support AP, client, Adhoc, Repeater, Repeater Bridge and WDS (optional) mode.
- WIFI support WEP, WPA, WPA2 encryption, Support RADIUS authentication and MAC address filter.
- Support APN/VPDN.
- Support DHCP server and client, firewall, NAT, DMZ host, URL block, QoS, tariff, statistics, real time link speed statistics etc.
- Full protocol support, such as TCP/IP, UDP, ICMP, SMTP, HTTP, POP3, OICQ, TELNET, FTP, SNMP, SSHD, etc.
- Schedule Reboot, Schedule Online and Offline, etc.
- Supports San Telequip Cloud Platform (Centralized M2M management platform, to remote monitor, remote configure, update firmware etc.).

1.3 Working Principle

The principal chart of the Cellular Gateway is as following:



1.4 Specifications

Cellular Specification

GSF M2M-200R-W WCDMA WIFI Cellular Gateway			
UMTS/WCDMA/HSDPA/HSUPA 850/1900/2100MHz, 850/900/1900/2100MHz(optional) GSM850/900/1800/1900MHz GPRS/EDGE CLASS 12	HSDPA:7.2Mbps (DL) HSUPA:5.76Mbps (UL) UMTS:384Kbps (DL/UL)	<24 dBm	<-109 dBm
GSF M2M-200R-FL LTE/WCDMA WIFI Cellular Gateway			
FDD-LTE 2600/2100/1800/900/800MHz (Band1/3/7/8/20) 700/850/1700/1900/2100MHz (Band 2/4/5/13/17/25) (Optional) DC-HSPA+/HSPA+/HSDPA/HSUPA/WCDMA/UMTS 2100/1900/900/850/800MHz (Band 1/2/5/6/8） EDGE/GPRS/GSM 850/900/1800/1900MHz	FDD-LTE: 100Mbps (DL), 50Mbps (UL) HSUPA: 5.76Mbps (UL) HSDPA: 7.2Mbps (DL) UMTS: 384Kbps (DL), 384Kbps (UL) HSPA+: 42Mbps (DL),5.76Mbps (UL)	<23 dBm	<-93.3 dBm
GSF M2M-200R-L LTE WIFI Cellular Gateway			
TDD-LTE FDD-LTE	FDD-LTE: 100Mbps (DL),50Mbps (UL)	<23dBm	<-93.3 dBm

EVDO WCDMA TD-SCDMA CDMA1X GPRS/EDGE	TDD-LTE: 61Mbps (DL),18Mbps (UL) CDMA2000 1X EVDO Rev A: 3.1Mbps (DL),1.8Mbps (UL) WCDMA: 42Mbps (DL),5.76Mbps (UL) TD-SCDMA: 4.2Mbps (DL),2.2Mbps (UL)		

WIFI Specification

Item	Content
Standard	IEEE802.11b/g/n
Bandwidth	IEEE802.11b/g: 54Mbps (max) IEEE802.11n: 150Mbps (max)
Security	WEP, WPA, WPA2, etc. WPS (optionnel)
TX power	20dBm(11n),24dBm(11g),26dBm(11b)
RX sensitivity	<-72dBm@54Mpbs

Hardware System

Item	Content
CPU	Industrial 32bits CPU
FLASH	16MB (Extendable to 32MB)
DDR2	128MB

Interface Type

Item	Content
WAN	1 10/100 Mbps WAN port (RJ45, with LED), auto MDI/MDIX, 1.5KV magnetic isolation protection
LAN	4 10/100/1000 Mbps Ethernet ports (RJ45, with LED), auto MDI/MDIX, 1.5KV magnetic isolation protection
Serial	1 RS232, RS485(RS422) port, 15KV ESD protection Data bits: 5, 6, 7, 8 Stop bits: 1, 1.5(optional), 2 Parity: none, even, odd, space(optional), mark(optional) Baud rate: 2400~115200 bps
Indicator	"PWR", "SYS", "WIFI", "SIM", "Online", "Signal Strength"
Input/Output	(6) pin 3.5mm terminal block (2) DI (Digital Input), (1) DO, (1) Relay Input ON Voltage: 5 to 30 VDC Input OFF Voltage: 0 to 3 VDC Output < 50mA @ 30VDC

	Relay:1A 250VAC/30VDC
Antenna	Cellular:2 Standard SMA female interface, 50-ohm, lighting protection(optional) WIFI: 1 Standard SMA male interface, 50-ohm, lighting protection(optional) GPS:1 Standard SMA female interface, 50-ohm, lighting protection(optional)
SIM/UIM	Standard 3V/1.8V user card interface, 15KV ESD protection
Power	2PIN Terminal block reverse-voltage and over-voltage protection
Reset	Restore the Cellular Gateway to its original factory default settings

Power Input

Item	Content
Standard Power	DC 12V/1.5A
Power Range	DC 5~36V

Consumption

Working condition	Consumption
Schedule shutdown	2.57~4.2mA@12DVC
GSF M2M-200R-W WCDMA WIFI Cellular Gateway	
Standby	272~295mA@12VDC
Communication	283~360mA@12VDC
GSF M2M-200R-FL LTE/WCDMA WIFI Cellular Gateway	
Standby	280~330mA@12VDC
Communication	325~562mA@12VDC
GSF M2M-200R-L LTE WIFI Cellular Gateway	
Standby	293~326mA@12VDC
Communication	310~554mA@12VDC

Physical Characteristics

Item	Content
Housing	Iron, providing IP30 protection
Dimensions	134.8x115.7x45 mm
Weight	520 g

Environmental Limits

Item	Content
Operating Temperature	-35~+75ºC (-31~+167°F)
Storage Temperature	-40~+85ºC (-40~+185°F)
Operating Humidity	95% (non-condensing)

Chapter 2 Installation Introduction

2.1 General

The Cellular Gateway must be installed correctly to make it work properly.

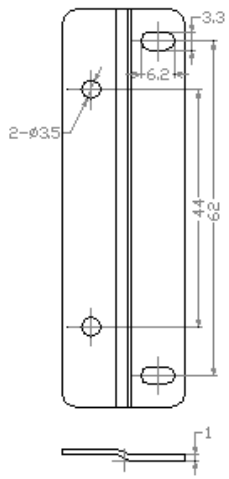
Warning: Forbid to install the Cellular Gateway when powered!

2.2 Encasement List

Name	Quantity	Remark
Cellular Gateway host	1	
Cellular antenna (Male SMA)	2	
WIFI antenna (Female SMA)	1	
Network cable	1	
Console cable	1	optional
RS485 Console cable	1	optional
Power adapter	1	optional

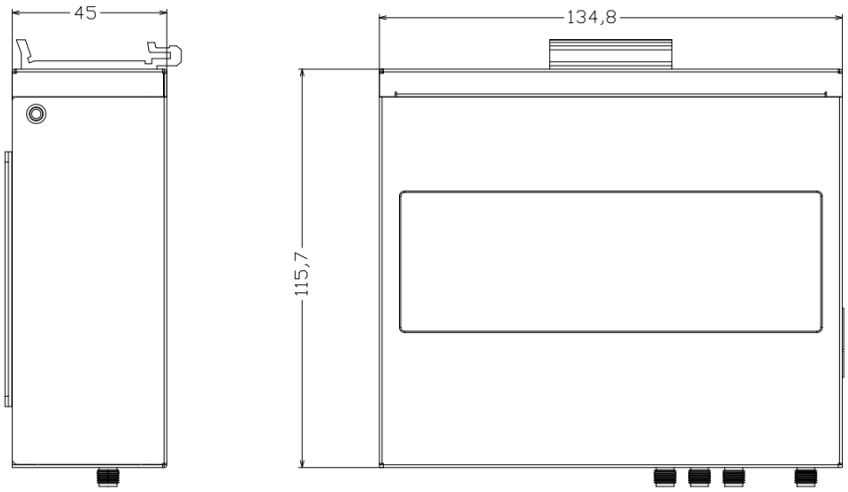
2.3 Installation and Cable Connection

Stator and routing equipment of screw specification for: M3 * 5 mm countersunk head screws (black)



Fixed Size

San Telequip (P) Ltd.,
504 & 505 Deron Heights, Baner Road
Pune 411045, India
Phone : +91-20-27293455, 9764027070, 8390069393
email : info@santelequip.com



Cellular Gateway Size

Installation of SIM/UIM card:

1.Firstly, power off the Cellular Gateway

2.Unscrewed the screw

3.Press the out button of the SIM/UIM card outlet with a needle object. Then the SIM/UIM card sheath will flick out at once

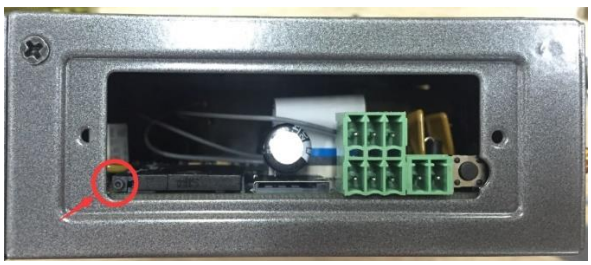
4.Put SIM/UIM card into the card sheath (Pay attention to put the side which has metal point outside) and insert card sheath back to the SIM/UIM card outlet.

5.Screwed the screw

Warning: Forbid installing SIM/UIM card when powered!

STEP:2

STEP 3:



STEP 4

STEP 5

Installation of antenna:

Screw the SMA male pin of the cellular antenna to the female SMA interface of the Cellular Gateway with sign "ANT-1" and "ANT-2". Screw the SMA female pin of the WIFI antenna to the male SMA interface of the Cellular Gateway with sign "WIFI."

Warning: The cellular antenna and the WIFI antenna cannot be connected wrongly. And the antennas must be screwed tightly, or the signal quality of antenna will be influenced!

Installation of cable:

Insert one end of the network cable into the switch interface with sign "LAN1/LAN2/LAN3/ LAN4" and insert the other end into the Ethernet interface of user's device. The signal connection of network direct cable is as follows:

RJ45-1	RJ45-2	Color
1	1	White/Orange
2	2	Orange
3	3	White/Green
4	4	Blue
5	5	White/Blue
6	6	Green
7	7	White/Brown
8	8	Brown

Insert the RJ45 end of the console cable into the RJ45 outlet with sign “console” and insert the DB9F end of the console cable into the RS232 serial interface of user’s device.
The signal connection of the console cable is as follows:

Console line definition (RS232)					
RJ45	**Color**	**Signal**	**DB9F**	**Description**	**Dir (Cellular Gateway**
1	White/ Orange	A	8	RS485-A	Input/Output
2	Orange	B	6	RS485-B	Input/Output
3	White/ Green	RXD	2	Receive Data	Output
4	Blue	DCD	1	Data Carrier Detect	Output
5	White/ Blue	GND	5	System Ground	
6	Green	TXD	3	Transmit Data	Input
7	White/ Brown	DTR	4	Data Terminal Ready	Input
8	Brown	RTS	7	Request To Send	Input

2.4 Power

The power range of the Cellular Gateway is DC 5~36V.
Warning: When we use other power, we should make sure that the power can supply power above 8W. We recommend users to use the standard DC 12V/1.5A power.

2.5 Indicator Lights Introduction

The Cellular Gateway provides following indicator lights: “Power,” “System,” “Online,” “SIM,” “LAN,” “WAN,” “WIFI,” “Signal Strength.”
\

Indicator Light	State	Introduction
PWR	ON	Cellular Gateway is powered on
	OFF	Cellular Gateway is powered off
SYS	BLINK	System works properly
	OFF	System does not work
Online	ON	Cellular Gateway has logged on network
	OFF	Cellular Gateway has not logged on network
SIM	ON	The SIM card has been identified
	OFF	The SIM card is not recognized
LAN	OFF	The corresponding interface of switch is not connected

	ON / BLINK	The corresponding interface of switch is connected /Communicating
WAN	OFF	The interface of WAN is not connected
	ON / BLINK	The interface of WAN is connected /Communicating
WIFI	OFF	WIFI is not active
	ON	WIFI is active
Signal Strength	One Light ON	Signal strength is weak
	Two Lights ON	Signal strength is medium
	Three Lights ON	Signal strength is good

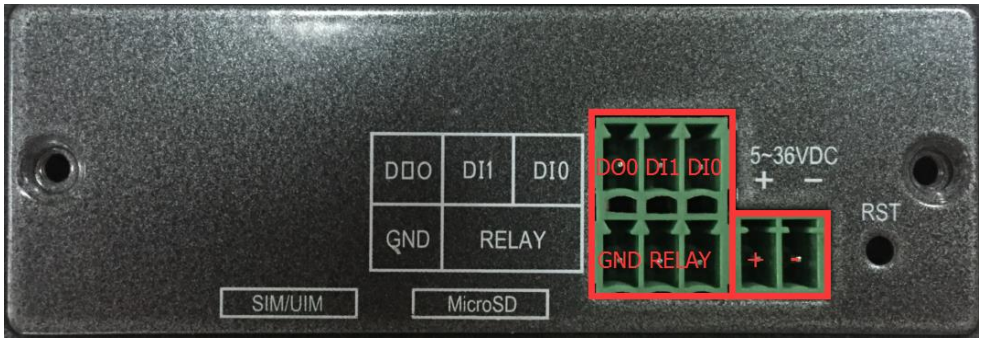
2.6 Reset Button Introduction

The Cellular Gateway has a “Reset” button to restore it to its original factory default settings. When user press the “Reset” button for up to 15s, the Cellular Gateway will restore to its original factory default settings and restart automatically.

2.7 Flank Interface

The Flank Interface as picture below, the Cellular Gateway provides 2 Direct Input,1 Direct Output,1 Relay control.

DI	Input ON	5 to 30 VDC
	Input OFF	0 to 3 VDC
DO	Output	< 50mA @ 30VDC
RELAY	Load capability	1A 250VAC/30VDC



Chapter 3 Configuration and Management

This chapter describes how to configure and manage the Cellular Gateway.

3.1 Configuration Connection

Before configuration, you should connect the Cellular Gateway and your configuration PC with the supplied network cable. Plug the cable's one end into the Local Network port of the Cellular Gateway, and another end into you configure PC's Ethernet port. The connection diagram is as following:

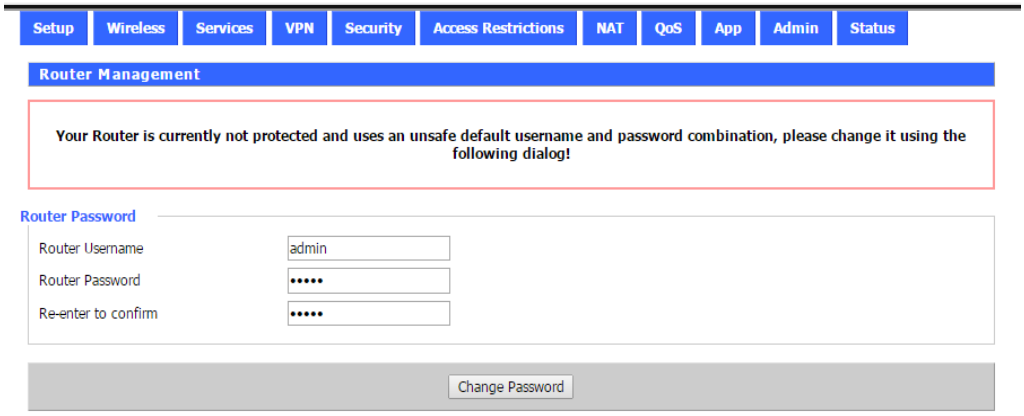
Please modify the IP address of PC as the same network segment address of the Cellular Gateway, for instance, 192.168.1.9. Modify the mask code of PC as 255.255.255.0 and set the default gateway of PC as the Cellular Gateway's IP address (192.168.1.1).

3.2 Access the Configuration Web Page

The chapter is to present the main functions of each page. Users visit page tool via web browser after connecting the users' PC to the Cellular Gateway. There are eleven main pages: Setting, Wireless, Service, VPN, Security, Access Restrictions, NAT, QoS Setting, Applications, Management and Status. Users are enabled to browse slave pages by clicking on one main page.

Users can open IE or other explorers and enter the Cellular Gateway's default IP address of 192.168.1.1 on address bar, then press the bottom of Enter to visit page Web management tool of the Cellular Gateway. The user's login in the web page at the first name, there will display a page shows as below to tip users to modify the default username and password of the Cellular Gateway. Users must click "change password" to make it work if they modify username and password.

After access to the information main page



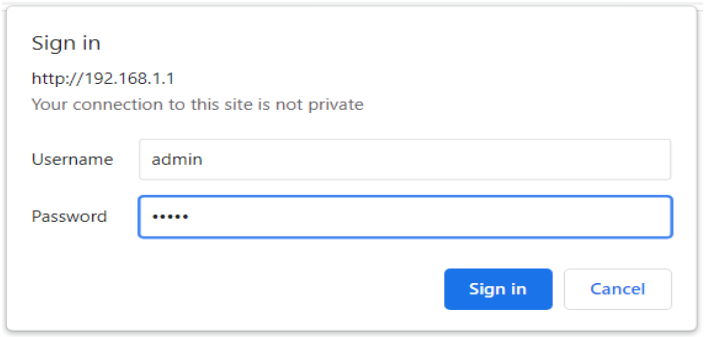
Users need to input username and password if it is their first time to login.

Input correct username and password to visit relevant menu page. Default username is admin, password is admin. (available to modify username and password on management page, then click submit)

3.3 Management and configuration

3.3.1 Setting

The Setup screen is the first screen users will see when accessing the Cellular Gateway. Most users will be able to configure the Cellular Gateway and get it to work properly using only the settings on this screen. Some Internet Service Providers (ISPs) will require users to enter



specific information, such as Username, Password, IP Address, Default Gateway Address, or DNS IP Address. This information can be obtained from your ISP, if required.

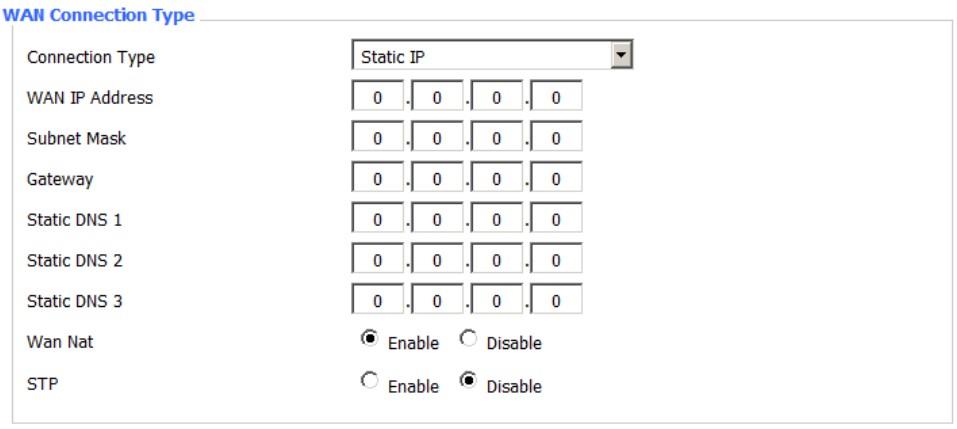
3.3.1.1 Basic Setting

WAN Connection Type
Seven Ways: Disabled, Static IP, Automatic Configuration-DHCP, PPPOE, 3G/UNMTS/4G/LTE, DHCP-4G.

Disabled

Forbid the setting of WAN port connection type

Static IP

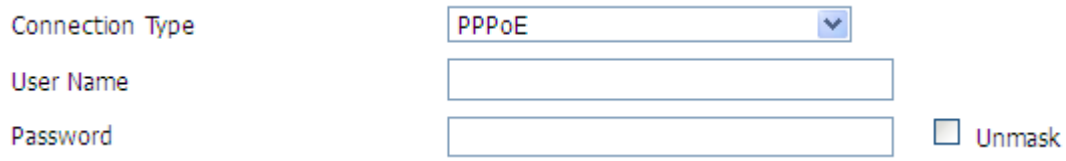


WAN IP Address: Users set IP address by their own or ISP assigns
Subnet Mask: Users set subnet mask by their own or ISP assigns
Gateway: Users set gateway by their own or ISP assigns
Static DNS1/DNS2/DNS3: Users set static DNS by their own or ISP assigns

Automatic Configuration-DHCP

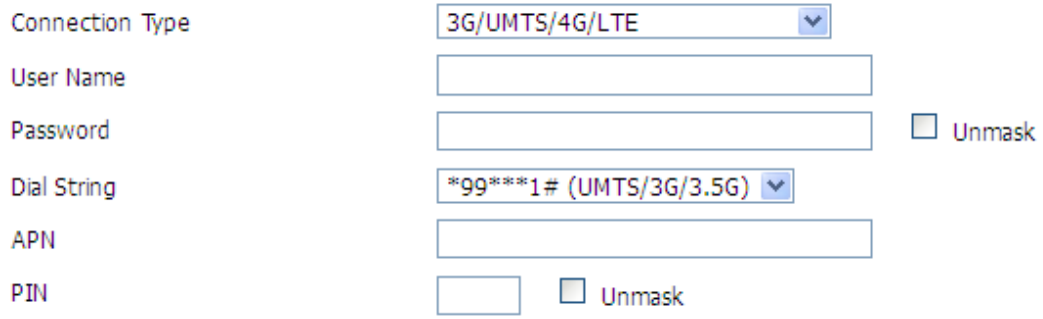
IP address of WAN port gets automatic via DHCP

PPPOE



Username: login the Internet
Password: login the Internet

3G/UMTS/4G/LTE



Username: login users' ISP (Internet Service Provider)
Password: login users' ISP
Dial String: dial number of users' ISP
APN: access point name of users' ISP
PIN: PIN code of users' SIM card

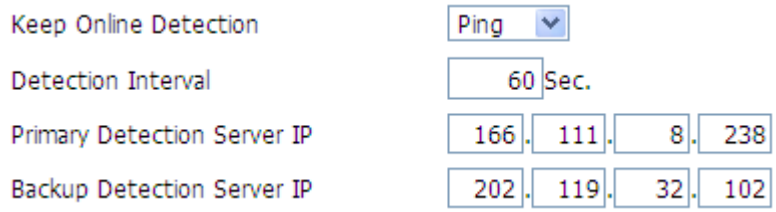
Connection type

Connection type: Auto, Force 3G, Force 2G, prefer 3G, Prefer 2G options. If using a 4G module, there is a 4G network option. Users select different mode depending on their need

DHCP-4G

IP address of WAN port gets automatic via DHCP-4G

Keep Online



This function is used to detect whether the Internet connection is active, if users set it and when the Cellular Gateway detects the connection is inactive, it will redial to users' ISP immediately to make the connection active. If the network is busy or the user is in private network, we recommend that Cellular Gateway mode will be better.

Detection Method:

None: do not set this function

Ping: Send ping packet to detect the connection, when choose this method, users should also configure "Detection Interval", "Primary Detection Server IP" and "Backup Detection Server IP" items.

Route: Detect connection with route method, when choose this method, users should also configure "Detection Interval", "Primary Detection Server IP" and "Backup Detection Server IP" items.

PPP: Detect connection with PPP method, when choose this method, users should also configure "Detection Interval" item.

Detection Interval: time interval between two detections, unit is second

Primary Detection Server IP: the server used to respond to the Cellular Gateway's detection packet. This item is only valid for method "Ping" and "Route".

Backup Detection Server IP: the server used to respond to the Cellular Gateway's detection packet. This item is valid for method "Ping" and "Route".

Note: When users choose the "Route" or "Ping" method, it is quite important to make sure that the "Primary Detection Server IP" and "Backup Detection Server IP" are usable and stable, because they have to response the detection packet frequently.

Force reconnects: this option schedules the pppoe or 3G reconnection by killing the pppd daemon and restart it.

Time: needed time to reconnect

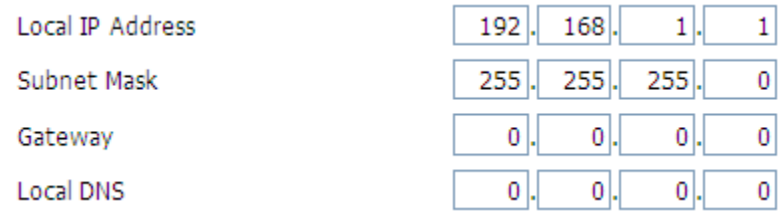
STP

STP (Spanning Tree Protocol) can be applied to loop network. Through certain algorithm achieves path redundancy, and loop network cuts to tree-based network without loop in the meantime, thus, to avoid the hyperplasia and infinite circulation of a message in the loop network

Optional Settings

Cellular Gateway Name: set Cellular Gateway name
Host Name: ISP provides
Domain Name: ISP provides
MTU: auto (1500) and manual (1200-1492 in PPPOE/PPTP/L2TP mode, 576-16320 in other modes)

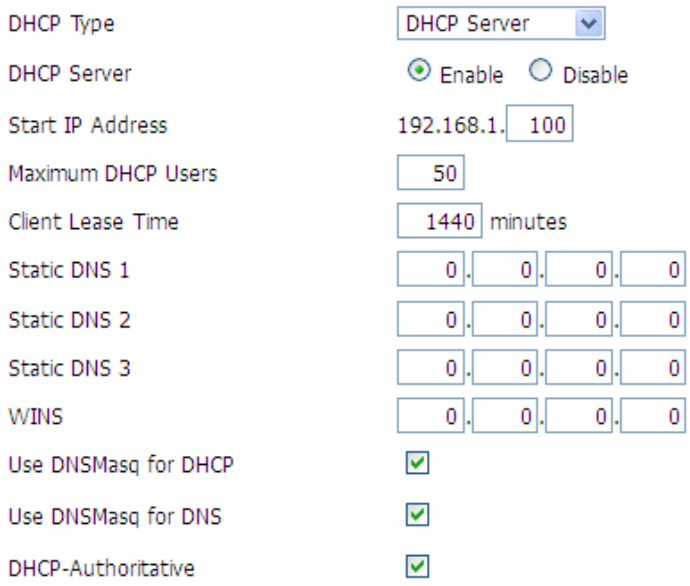
Cellular Gateway Internal Network Settings
Cellular Gateway IP



Local IP Address: IP address of the Cellular Gateway
Subnet Mask: the subnet mask of the Cellular Gateway
Gateway: set internal gateway of the Cellular Gateway. If default, internal gateway is the address of the Cellular Gateway
Local DNS: DNS server is auto assigned by network operator server. Users enable to use their own DNS server or other stable DNS servers, if not, keep it default

Network Address Server Settings (DHCP)
These settings for the Cellular Gateway's Dynamic Host Configuration Protocol (DHCP) server functionality
configuration. The Cellular Gateway can serve as a network DHCP server. DHCP server automatically assigns an IP address for each computer in the network. If they choose

to enable the Cellular Gateway's DHCP server option, users can set all the computers on the LAN to automatically obtain an IP address and DNS, and make sure no other DHCP server in the network.



DHCP Type: DHCP Server and DHCP Forwarder

Enter DHCP Server if set DHCP Type to DHCP Forwarder as blow:

DHCP Server: keep the default Enable to enable the Cellular Gateway's DHCP server option. If users have already had a DHCP server on their network or users do not want a DHCP server, then select Disable

Start IP Address: enter a numerical value for the DHCP server to start with when issuing IP addresses. Do not start with 192.168.1.1 (the Cellular Gateway's own IP address).

Maximum DHCP Users: enter the maximum number of PCs that users want the DHCP server to assign IP addresses to. The absolute maximum is 253 if 192.168.1.2 is users' starting IP address.

Client Lease Time: the Client Lease Time is the amount of time a network user will be allowed connection to the Cellular Gateway with their current dynamic IP address. Enter the amount of time, in minutes, that the user will be "leased" this dynamic IP address.

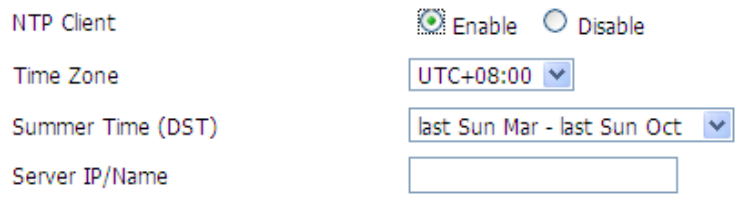
Static DNS (1-3): the Domain Name System (DNS) is how the Internet translates domain or website names into Internet addresses or URLs. Users' ISP will provide them with at least one DNS Server IP address. If users wish to utilize another, enter that IP address in one of these fields. Users can enter up to three DNS Server IP addresses here. The Cellular Gateway will utilize them for quicker access to functioning DNS servers.

WINS: the Windows Internet Naming Service (WINS) manages each PC's interaction with the Internet. If users use a WIN'S server, enter that server's IP address here. Otherwise, leave it blank.

DNSMasq: users' domain name in the field of local search, increase the expansion of the host option, to adopt DNSMasq can assign IP addresses and DNS for the subnet, if select DNSMasq, dhcpd service is used for the subnet IP address and DNS.

Time Settings

Select the time zone of your location. To use local time, leave the checkmark in the box next to Use local time.



NTP Client: Get the system time from NTP server

Time Zone: Time zone options

Summer Time (DST): set it depends on users' location

Server IP/Name: IP address of NTP server, up to 32 characters. If blank, the system will find a server by default

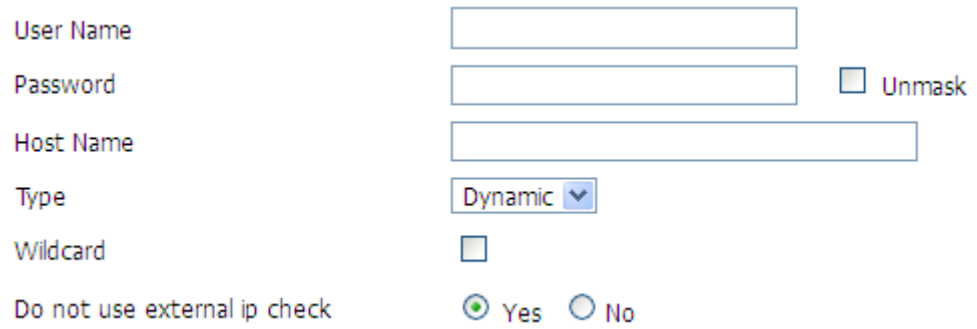
Adjust Time

To adjust time by the system and refresh to get the time of the web, user can set to modify the time of the system. They can change to adjust time by manual to achieve adjust time by the system if the system fails to get NTP server

3.3.1.2 Dynamic DNS

If a user's network has a permanently assigned IP address, users can register a domain name and have that name linked with their IP address by public Domain Name Servers (DNS). However, if their Internet account uses a dynamically assigned IP address, users will not know in advance what their IP address will be, and the address can change frequently. In this case, users can use a commercial dynamic DNS service, which allows them to register their domain to their IP address and will forward traffic directed at their domain to their frequently changing IP address.

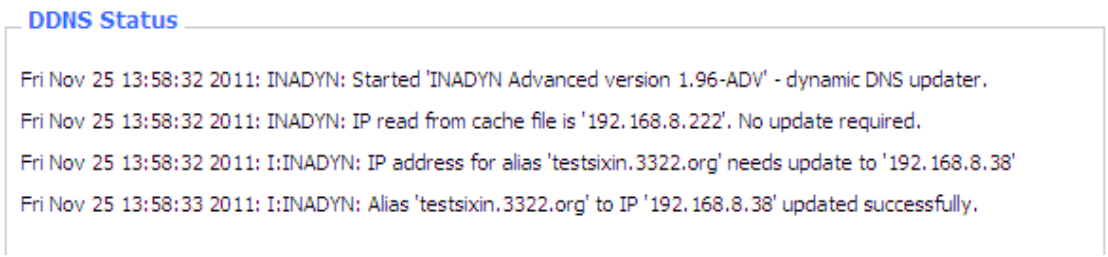
DDNS Service: Cellular Gateway currently supports DynDNS, freedns, Zone edits, NO-IP, 3322, easyDNS, TZO, Dyn SIP and Custom based on the user.



Username: users register in DDNS server, up to 64 characteristics
Password: password for the username that users register in DDNS server, up to 32 characteristics
Host Name: users register in DDNS server, no limited for input characteristic for now
Type: depends on the server
Wildcard: support wildcard or not, the default is OFF. ON means *.host.3322.org is equal to host.3322.org
Do not use external Ip check: enable or disable the function of 'do not use external Ip check'

Force Update Interval: unit is day, try forcing the update dynamic DNS to the server by settled days

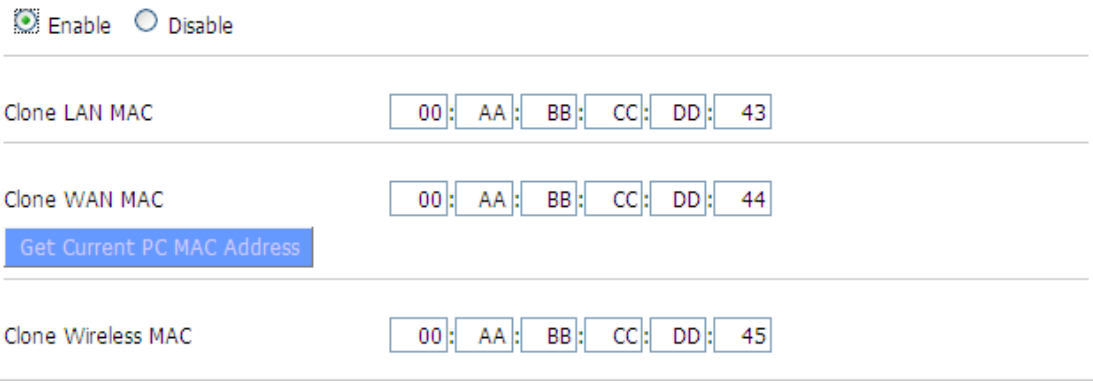
Status



DDNS Status shows connection log information

3.3.1.3 Clone MAC Address

Some ISP need the users to register their MAC address. The users can clone the Cellular Gateway MAC address to their MAC address registered in ISP if they do not want to re-register their MAC address.

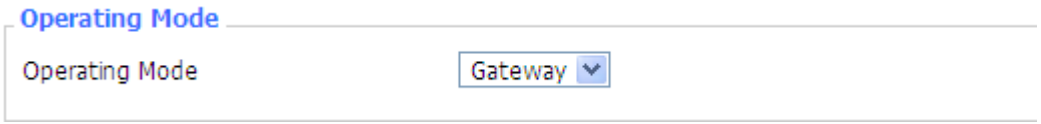


Ione MAC address can clone three parts: Clone LAN MAC, Clone WAN MAC, Clone Wireless MAC.

Noted that one MAC address is 48 characteristics, cannot be set to the multicast address, the first byte must be even. And the MAC address value of network bridge br0 is determined by the smaller value of wireless MAC address and LAN port MAC address.

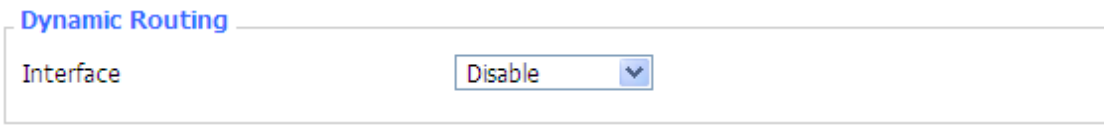
3.3.1.4 Advanced Cellular Gateway

Operating Mode: Gateway and Cellular Gateway



If the Cellular Gateway is hosting users' Internet connection, select Gateway mode. If another Cellular Gateway exists on their network, select Cellular Gateway mode.

Dynamic Routing

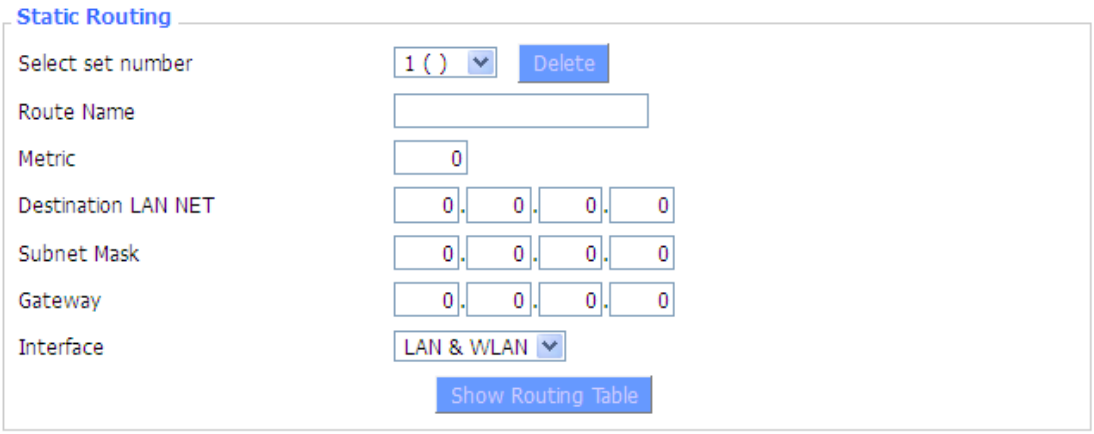


Dynamic Routing enables the Cellular Gateway to automatically adjust to physical changes in the network's layout and exchange routing tables with other Cellular Gateways. The Cellular Gateway determines the network packets' route based on the fewest number of hops between the source and destination.

To enable the Dynamic Routing feature for the WAN side, select WAN. To enable this feature for the LAN and wireless side, select LAN&WLAN. To enable the feature for both the WAN and LAN, select Both. To disable the Dynamic Routing feature for all data transmissions, keep the default setting, Disable.

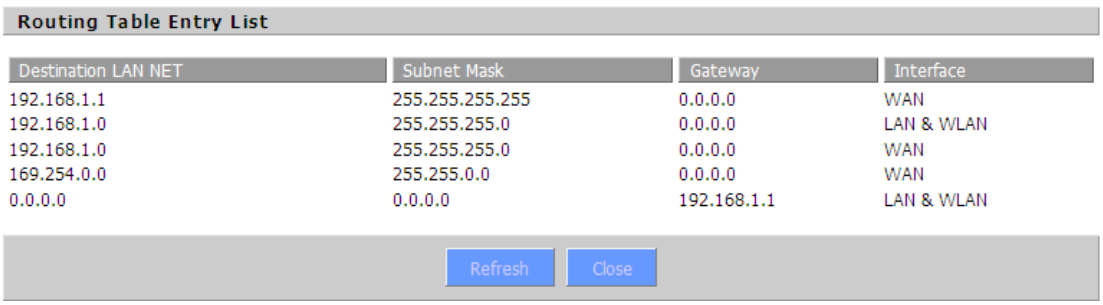
Note Dynamic Routing is not available in Gateway mode

Static Routing

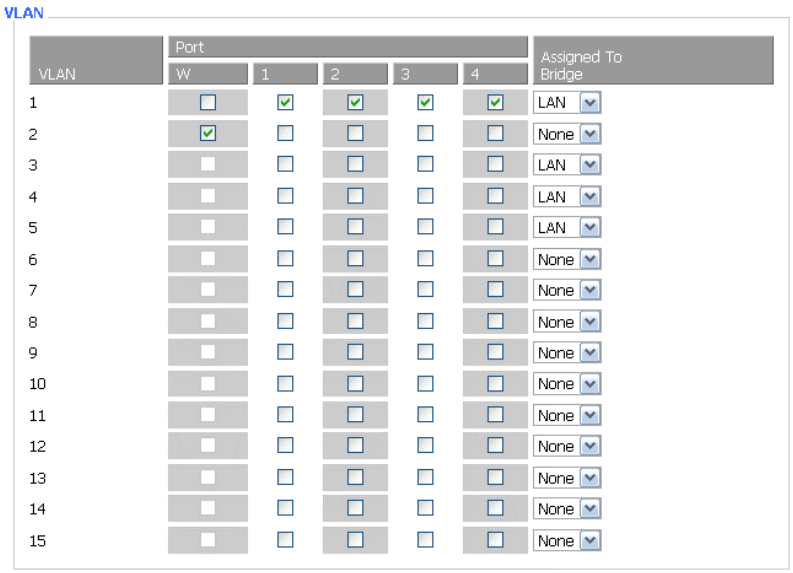


Select set number: 1-50
Route Name: defined routing name by users, up to 25 characters
Metric: 0-9999
Destination LAN NET: the Destination IP Address is the address of the network or host to which users want to assign a static route
Subnet Mask: the Subnet Mask determines which portion of an IP address is the network portion, and which portion is the host portion
Gateway: IP address of the gateway device that allows for contact between the Cellular Gateway and the network or host.
Interface: indicate users whether the Destination IP Address is on the LAN & WLAN (internal wired and wireless networks), the WAN (Internet), or Loopback (a dummy network in which one PC acts like a network, necessary for certain software programs)

Show Routing Table

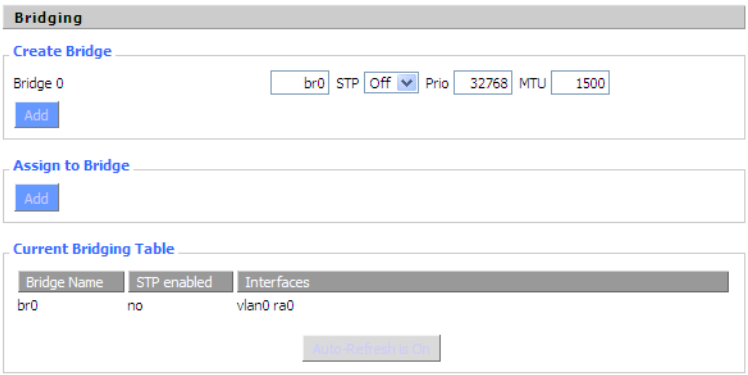


3.3.1.5 VLANs



VLANs function is to divide different VLAN ports by users' will. The system supports 15 VLAN ports from VLAN1-VLAN15. However, there are only 5-time ports (1 WAN port and 4 LAN port) divided by users themselves, and LAN port and WAN port disable to divide into one VLAN port meanwhile.

3.3.1.6 Networking



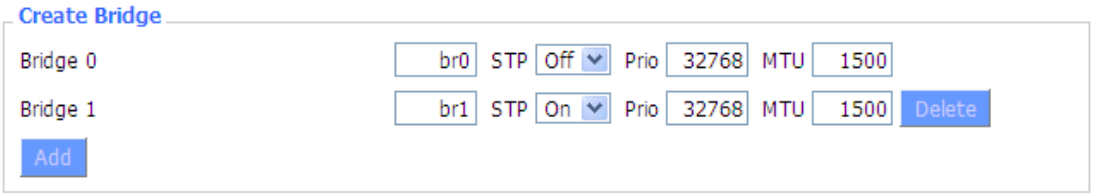
Bridging-Create Bridge: creates a new empty network bridge for later use. STP means Spanning Tree Protocol and with PRIO users can set the bridge priority order. The lowest number has the highest priority.

Bridging - Assign to Bridge: allows users to assign any valid interface to a network bridge. Consider setting the Wireless Interface options to Bridge if they want to assign any Wireless Interface here. Any system specific bridge setting can be overridden here in this field.

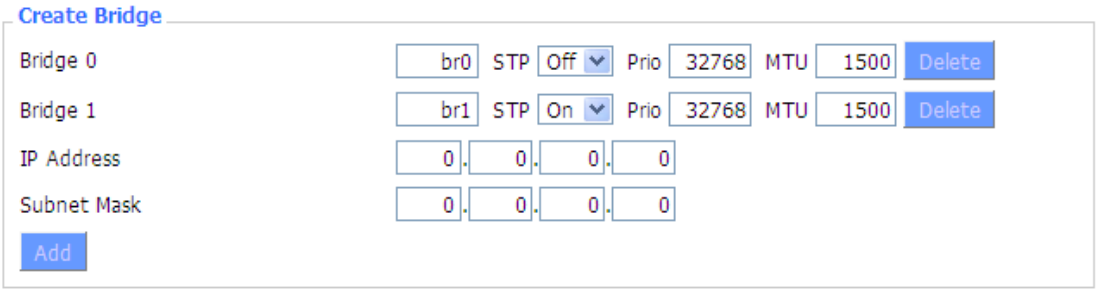
Current Bridging Table: shows current bridging table

Create steps as below:

Click 'Add' to create a new bridge, configuration is as below:

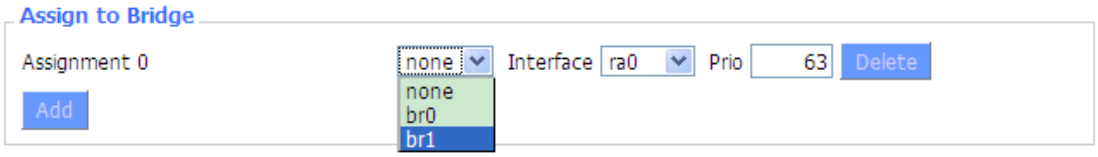


Create bridge option: the first br0 means bridge name. STP means to on/off spanning tree protocol. Prio means priority level of STP, the smaller the number, the higher the level. MTU means maximum transfer unit, default is 1500, delete if it is not needed. And then click 'Save' or 'Add'. Bride properties is as below:



Enter relevant bridge IP address and subnet mask, click 'Add' to create a bridge.

Note: Only if you create a bride can you apply for it.



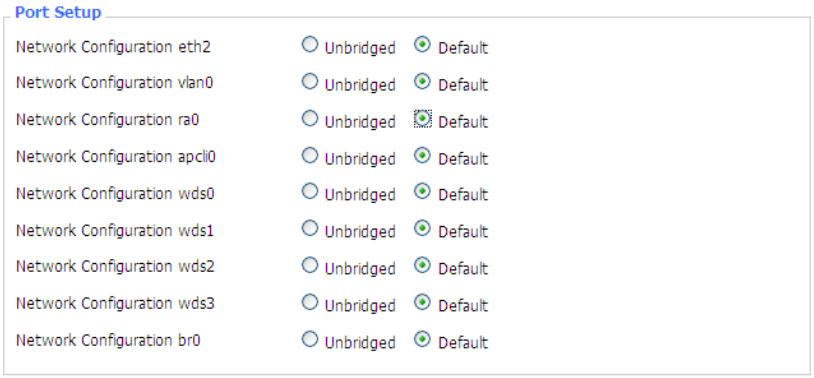
Assign to Bridge option: to assign different ports to created bridge. For example: assign port (wireless port) is ra0 in br1 bridge as below:

Prio means priority level: work if multiple ports are within the same bridge. The smaller the number, the higher the level. Click 'Add' to take it effect.

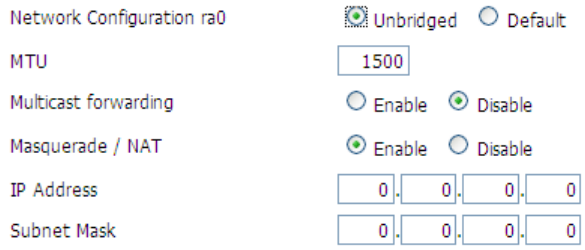
Note: corresponding interface of WAN ports interface should not be binding, this bridge function is used for LAN port, and should not be binding with WAN port

If bind success, bridge binding list in the list of current bridging table is as below:

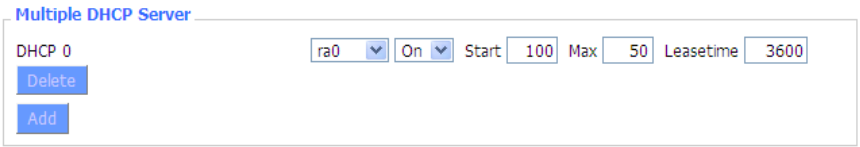
To make br1 bridge has the same function with DHCP assigned address, users need to set multiple DHCP function, see the introduction of multi-channel DHCPD:



Port Setup: Set the port property, the default is not set



Choose not to bridge to set the port's own properties, detailed properties are as below:
MTU: maximum transfer unit
Multicast forwarding enable or disable multicast forwarding
Masquerade/NAT: enable or disable Masquerade/NAT
IP Address: set ra0's IP address, and do not conflict with other ports or bridge
Subnet Mask: set the port's subnet mask

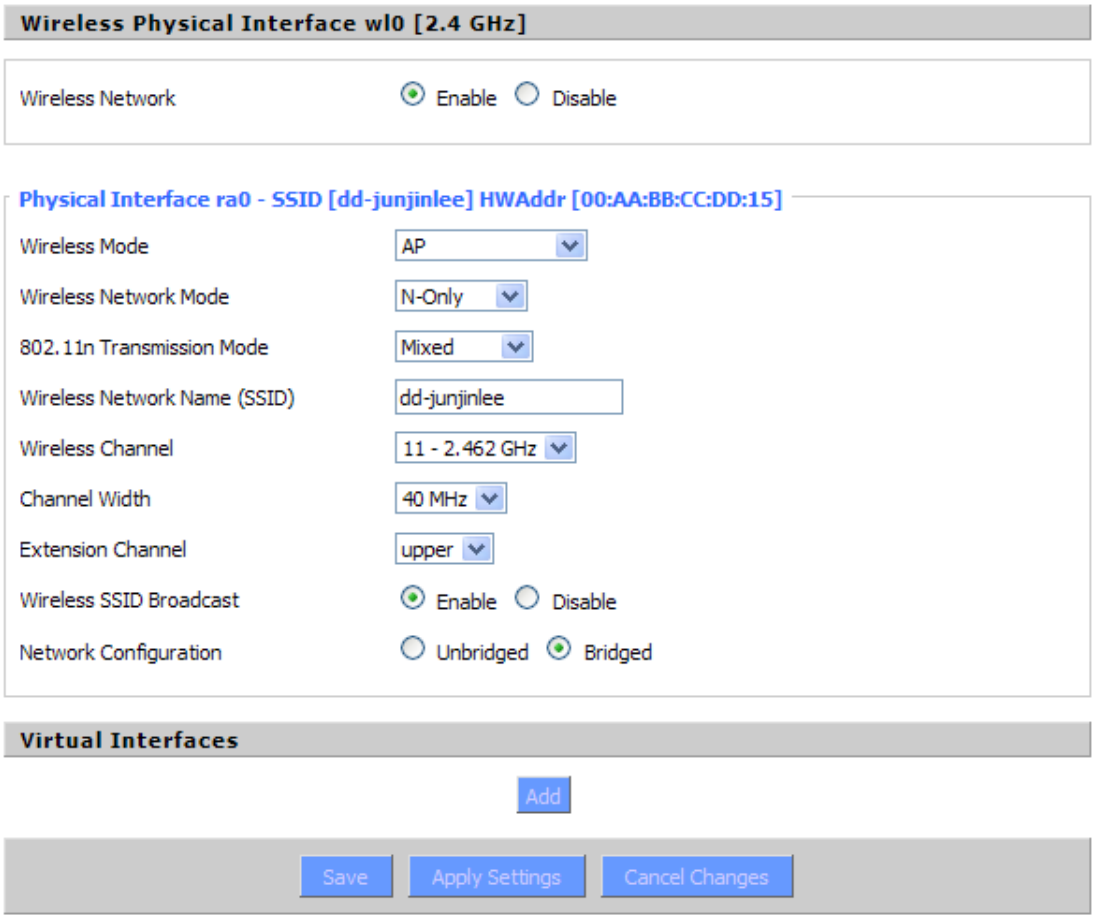


Multiple DHCPD: using multiple DHCP service. Click 'Add' in multiple DHCP server to appear relevant configuration. The first means the name of port or bridge (do not be configured as eth0), the second means whether to on DHCP. Start means start address, Max means maximum assigned DHCP clients, Lease time means the client lease time, the unit is second, click 'Save' or 'Apply' to put it into effect after setting.

Note: Only configure and click 'Save' can configure the next, cannot configure multiple DHCP at the same time.

3.3.2 Wireless

3.3.2.1 Basic Settings



Wireless Network：“Enable,” radio on.
“Disable,” radio off.

Wireless Mode：AP, Client, Adhoc, Repeater, Repeater Bridge four options。

Wireless Network Mode：

Mixed：Support 802.11b, 802.11g, 802.11n wireless devices.

BG-Mixed：Support 802.11b, 802.11g wireless devices.

B-only：Only supports the 802.11b standard wireless devices.

B-only：Only supports the 802.11b standard wireless devices.

G-only：Only supports the 802.11g standard wireless devices.

NG-Mixed：Support 802.11g, 802.11n wireless devices.

N-only：Only supports the 802.11g standard wireless devices.

8021.11n Transmission Mode：In the wireless network mode to "N-only" choose to transfer its transmission mode.

Greenfield: When you determine the surrounding environment, there are no other 802.11a/b/g devices that use the same channel, use this mode to increase throughput. Other 802.11a/b/g

devices use the same channel in the environment, the information you send may generate an error, re-issued.

Mixed：This mode is contrary to the green mode but will reduce the throughput.

Wireless Network Name (SSID): The SSID is the network name shared among all devices in a wireless network. The SSID must be identical for all devices in the wireless network. It is case-sensitive and must not exceed 32 alphanumeric characters, which may be any keyboard character. Make sure this setting is the same for all devices in your wireless network. 。

Wireless Channel：A total of 1-13 channels to choose more than one wireless device environment, please try to avoid using the same channel with other devices. 。

Channel Width：20MHZ and 40MHZ。

Extension Channel：Channel for 40MHZ, you can choose upper or lower.

Wireless SSID Broadcast：

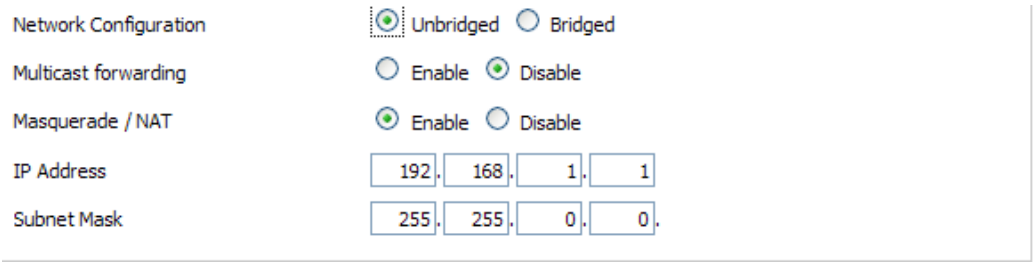
Enable：SSID broadcasting.

Disable：Hidden SSID.

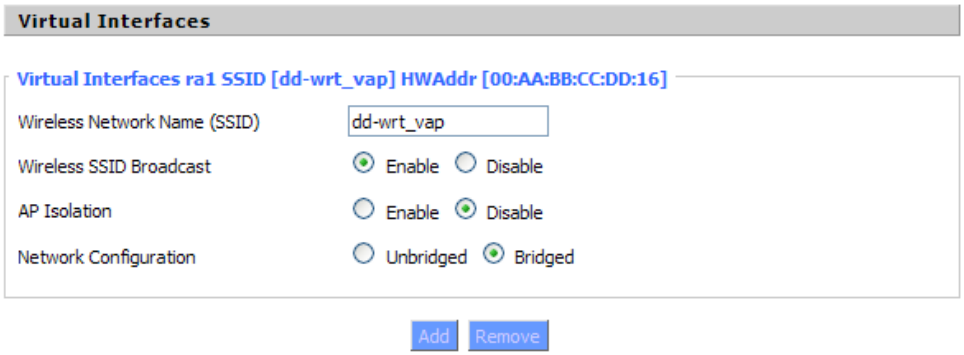
Network Configuration：

Bridged：Bridge to the Cellular Gateway, under normal circumstances, please select the bridge.

Unbridged：There is no bridge to the Cellular Gateway, IP addresses need to manually configure.



Virtual Interfaces：Click Add to add a virtual interface. Add successfully, click on the remove, you can remove the virtual interface。

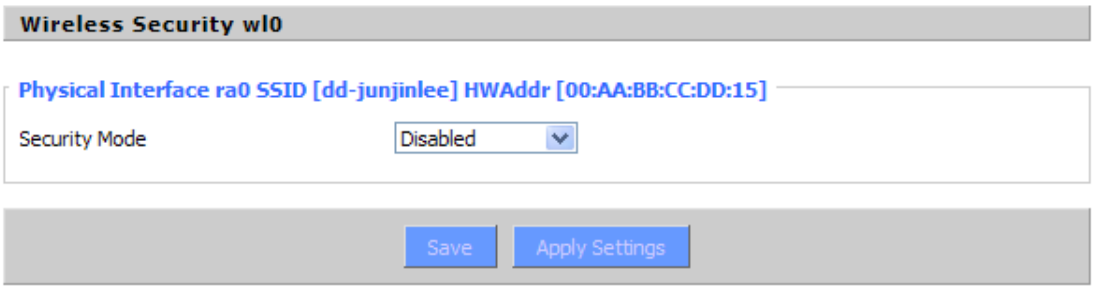


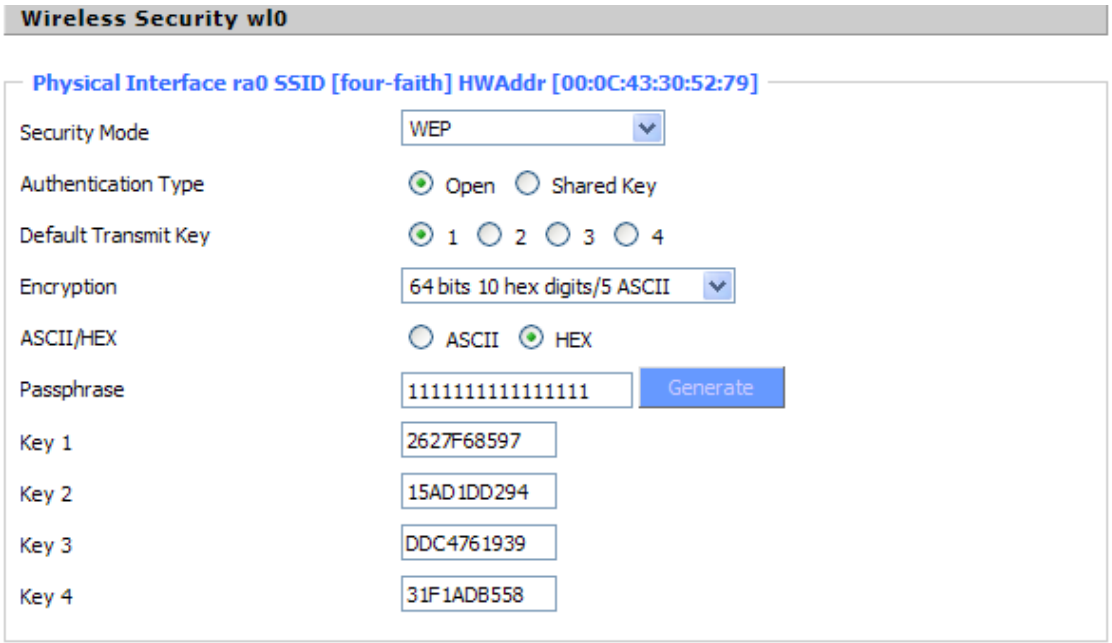
AP Isolation：This setting isolates wireless clients so access to and from other wireless clients is stopped.

Note：Save your changes, after changing the "Wireless Mode", "Wireless Network Mode", "wireless width", "broadband" option, please click on this button, and then configure the other options.

3.3.2.2 Wireless Security

Wireless security options are used to configure the security of your wireless network. This route is seven kinds of wireless security mode. Disabled by default, not safe mode is enabled. Such as changes in Safe Mode, click Apply to take effect immediately.





WEP：Is a basic encryption algorithm that being less secure than WPA.Use of WEP is discouraged due to security weaknesses, and one of the WPA modes should be used whenever possible. Only use WEP if you have clients that can only support WEP (usually older, 802.11b-only clients).

Authentication Type：Open or shared key。

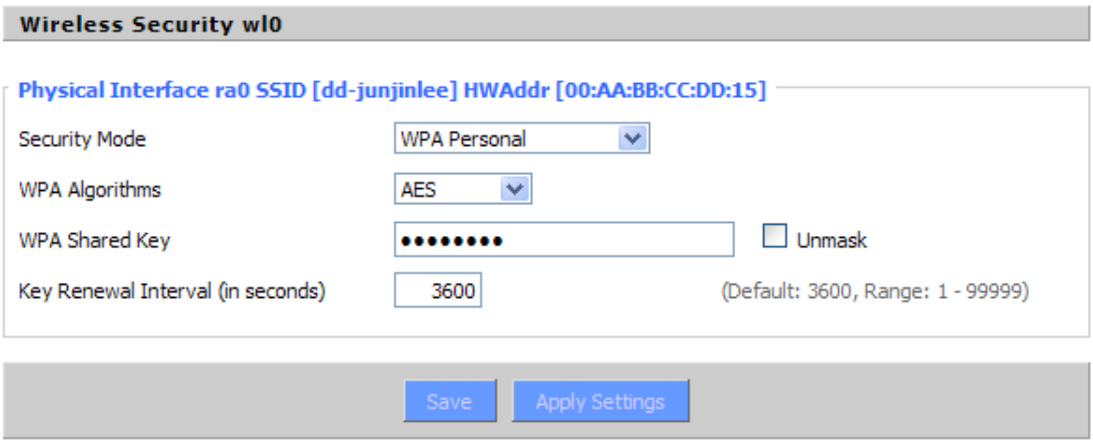
Default Transmit Key：Select the key form Key 1 - Key 4 key.

Encryption：There are two levels of WEP encryption, 64-bit (40-bit) and 128-bit. To utilize WEP, select the desired encryption bit, and enter a passphrase or up to four WEP keys in hexadecimal format. If you are using 64-bit (40-bit), then each key must consist of exactly 10 hexadecimal characters or 5 ASCII characters. For 128-bit, each key must consist of exactly 26 hexadecimal characters. Valid hexadecimal characters are "0"-"9" and "A"-"F".

ASCII/HEX: ASCII, the keys are 5-bit ASCII characters/13bit ASCII characters.
HEX, the keys are 10bit/26-bit hex digits.

Passphrase： The letters and numbers used to generate a key.

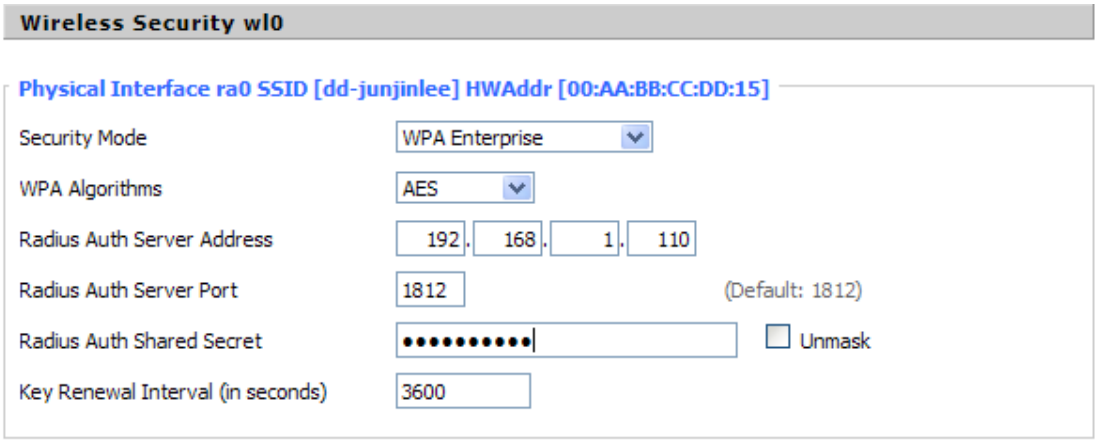
Key1-Key4： Manually fill out or generated according to input the pass phrase.



WPA Personal/WPA2 Personal/WPA2 Person Mixed: ， TKIP/AES/TKIP+AES，dynamic encryption keys. TKIP + AES, self-applicable TKIP or AES. WPA Person Mixed, allow WPA Personal and WPA2 Personal client mix.

WPA Shared Key Between 8 and 63 ASCII character or hexadecimal digits. 。

Key Renewal Interval in seconds）：1-99999。



WPA Enterprise/WPA2 Enterprise/WPA2 Enterprise Mixed: WPA Enterprise uses an external RADIUS server to perform user authentication.

WPA Algorithms: AES/TKIP/TPIP+AES.

Radius Auth Sever Address： The IP address of the RADIUS server.

Radius Auth Server Port： The RADIUS Port (default is 1812) 。

Radius Auth Shared Secret： The shared secret from the RADIUS server。

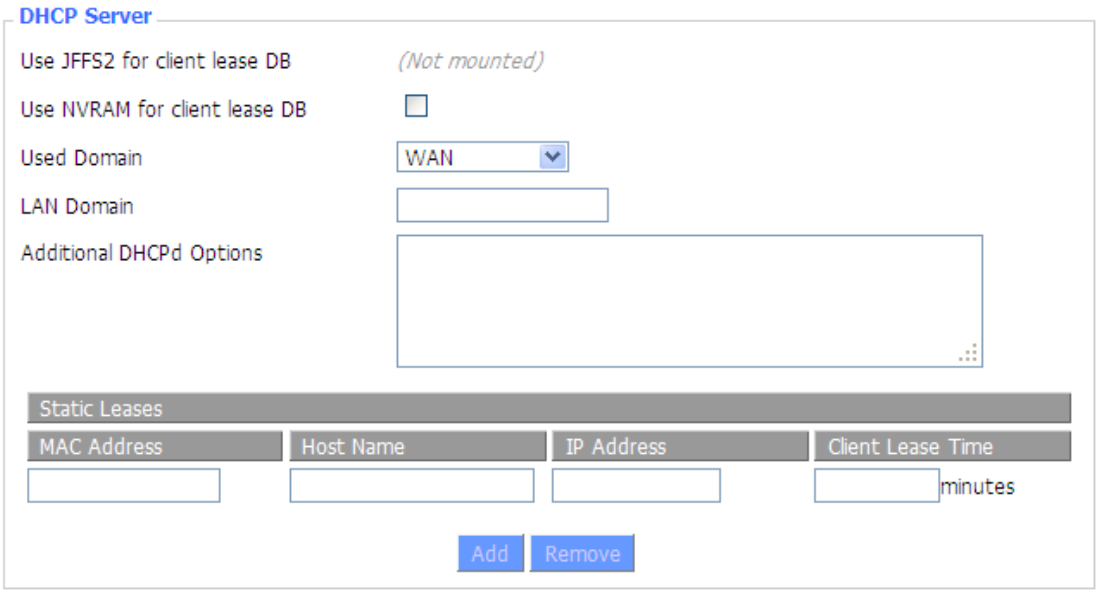
Key Renewal Interval (in seconds): 1-99999。

3.3.3 Services

3.3.3.1 Services

DHCP Server

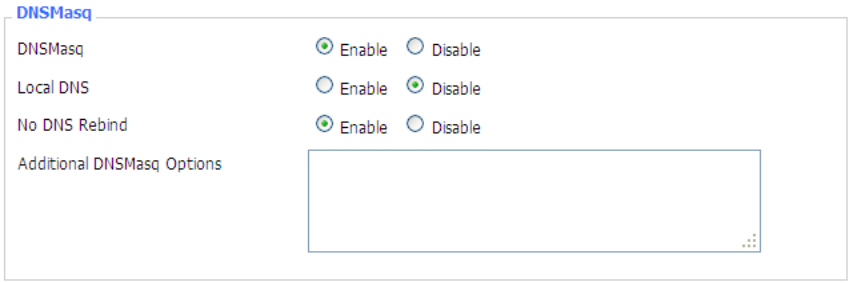
DHCPd assigns IP addresses to users' local devices. While the main configuration is on the setup page users can program some nifty special functions here.



Use NVRAM for client lease DB: users can store data to the system NVRAM area is enabled
Used domain: users can select here which domain the DHCP clients should get as their local domain. This can be the WAN domain set on the Setup screen or the LAN domain which can be set here.
LAN Domain: users can define here their local LAN domain which is used as local domain for DNSmasq and DHCP service if chosen above.
Static Leases: if users want to assign certain hosts a specific address, then they can define them here. This is also the way to add hosts with a fixed address to the Cellular Gateway's local DNS service (DNSmasq).
Additional DHCPd Options: some extra options users can set by entering them

DNSMasq

DNSmasq is a local DNS server. It will resolve all host names known to the Cellular Gateway from dhcp (dynamic and static) as well as forwarding and caching DNS entries from remote DNS servers. Local DNS enables DHCP clients on the LAN to resolve static and dynamic DHCP hostnames.



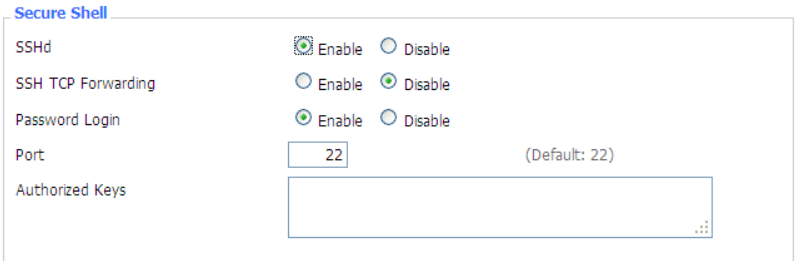
Local DNS: enables DHCP clients on the LAN to resolve static and dynamic DHCP hostnames
No DNS Rebind: when enabled, it can prevent an external attacker from accessing the Cellular Gateway's internal Web interface. It is a security measure
Additional DNSMasq Options: some extra options users can set by entering them in Additional DNS Options.
For example:
static allocation: dhcp-host=AB:CD: EF:11:22:33,192.168.0.10, myhost, myhost. domain,12h
max lease number: dhcp-lease-max=2
DHCP server IP range: dhcp-range=192.168.0.110,192.168.0.111,12h

SNMP

Location: equipment location
Contact: contact this equipment management
Name: device name
RO Community: SNMP RO community name, the default is public, only to read.
RW Community: SNMP RW community name, the default is private, Read-write permissions

SSHD

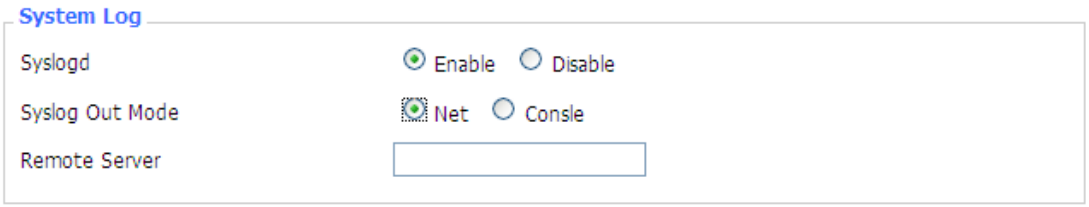
Enabling SSHd allows users to access the Linux OS of their Cellular Gateway with an SSH client.



SSH TCP Forwarding: enable or disable to support the TCP forwarding
Password Login: allows login with the Cellular Gateway password (username is admin)
Port: port number for SSHd (default is 22)
Authorized Keys: here users paste their public keys to enable key-based login (more secure than a simple password)

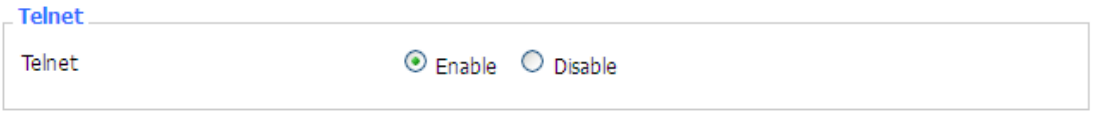
System log

Enable Syslogd to capture system messages. By default, they will be collected in the local file /var/log/messages. To send them to another system, enter the IP address of a remote syslog server.



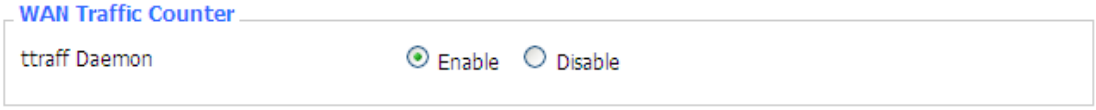
Syslog Out Mode: two log mode
Net: the log information output to a syslog server
Console: the log information output to console port
Remote Server: if choose net mode, users should input a syslog server's IP Address and run a syslog server program on it.

Telnet



Telnet: enable a telnet server to connect to the Cellular Gateway with telnet. The username is admin, and the password is the Cellular Gateway's password.
Note: If users use the Cellular Gateway in an untrusted environment (for example as a public hotspot), it is strongly recommended to use SSHd and deactivate telnet.

WAN Traffic Counter

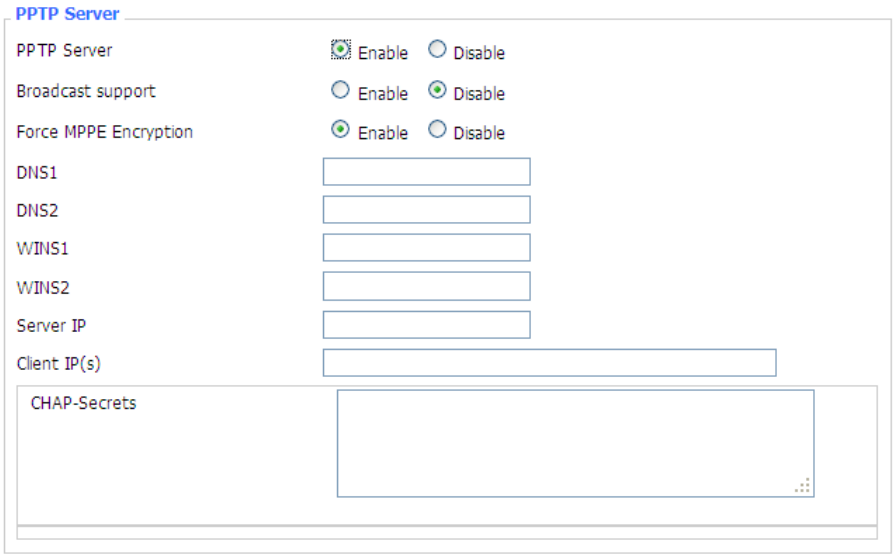


Ttraff Daemon: enable or disable wan traffic counter function

3.3.4 VPN

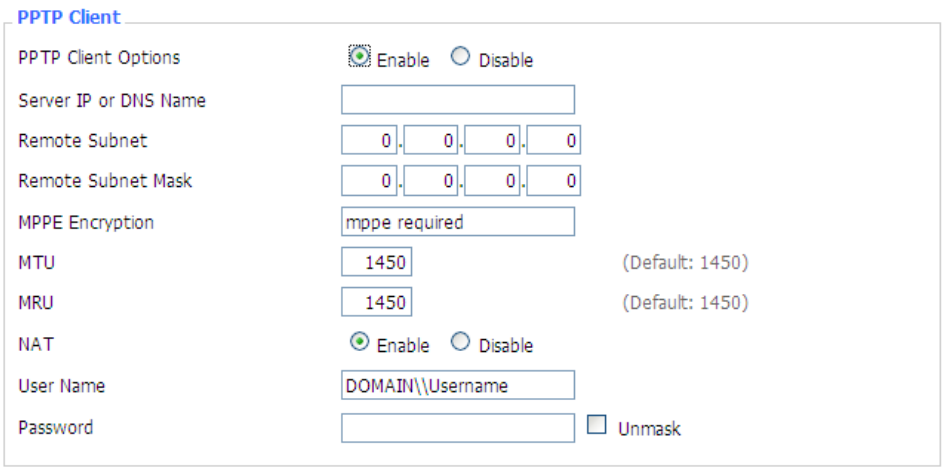
3.3.4.1 PPTP

PPTP Server



Broadcast support: enable or disable broadcast support of PPTP server
Force MPPE Encryption: enable of disabled force MPPE encryption of PPTP data
DNS1/DNS2/WINS1/WINS2: set DNS1/DNS2/WINS1/WINS2
Server IP: input IP address of the Cellular Gateway as PPTP server, differ from LAN address
Client IP(s): IP address assigns to the client, the format is xxx.xxx.xxx.xxx-xxx
CHAP Secrets: username and password of the client using PPTP service
Note: client IP must be different with IP assigned by Cellular Gateway DHCP. The format of CHAP Secrets is user * password *.

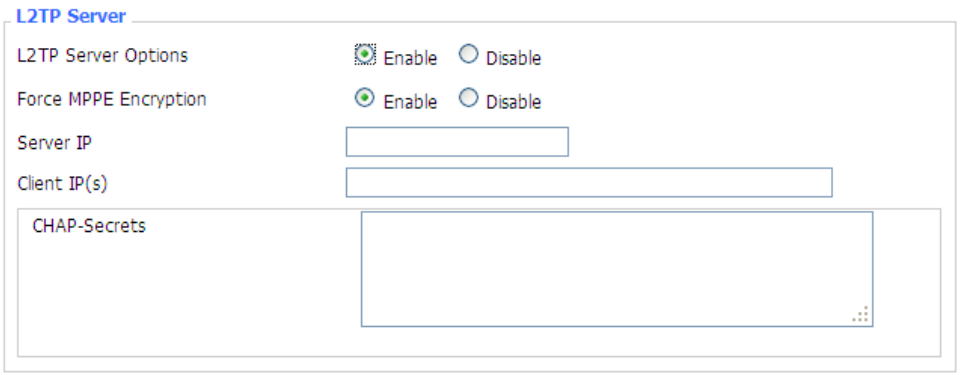
PPTP Client



Server IP or DNS Name: PPTP server's IP Address or DNS Name
Remote Subnet: the network of the remote PPTP server
Remote Subnet Mask: subnet mask of remote PPTP server
MPPE Encryption: enable or disable Microsoft Point-to-Point Encryption。
MTU: maximum Transmission Unit
MRU: maximum Receive Unit
NAT: network Address Translation
Username: username to login PPTP Server.
Password: password to log into PPTP Server.

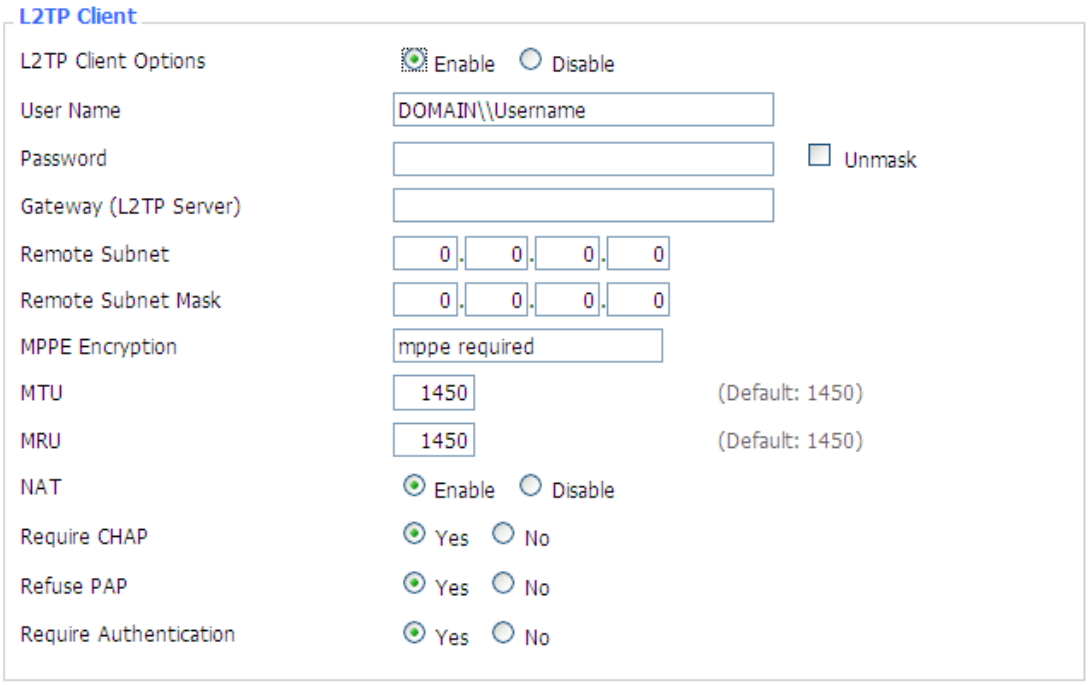
3.3.4.2 L2TP

L2TP Server



Force MPPE Encryption: enable or disable force MPPE encryption of L2TP data
Server IP: input IP address of the Cellular Gateway as PPTP server, differ from LAN address
Client IP(s): IP address assigns to the client, the format is xxx.xxx.xxx.xxx-xxx.xxx.xxx.xxx
CHAP Secrets: username and password of the client using L2TP service
Note: client IP must be different with IP assigned by Cellular Gateway DHCP.
The format of CHAP Secrets is user * password *.

L2TP Client



Gateway (L2TP Server): L2TP server's IP Address or DNS Name
Remote Subnet: the network of remote PPTP server
Remote Subnet Mask: subnet mask of remote PPTP server
MPPE Encryption: enable or disable Microsoft Point-to-Point Encryption
MTU: maximum transmission unit
MRU: maximum receive unit
NAT: network address translation
Username: username to login L2TP Server
Password: password to login L2TP Server
Require CHAP: enable or disable support chap authentication protocol
Refuse PAP: enable or disable refuse to support the pap authentication
Require Authentication: enable or disable support authentication protocol

3.3.4.3 OPENVPN

OPENVPN Server

Start Type: WAN UP----start after on-line, System----start when boot up

Config via: GUI----Page configuration, Config File----config File configuration

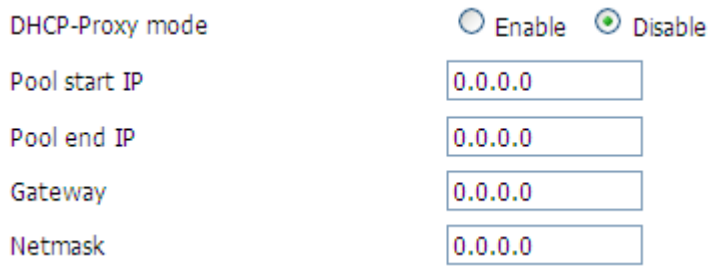
Server mode: Cellular Gateway (TUN)-route mode, Bridge (TAP)----bridge mode

Cellular Gateway (TUN):

Network: network address allowed by OPENVPN server

Netmask: netmask allowed by OPENVPN server

Bridge (TAP):



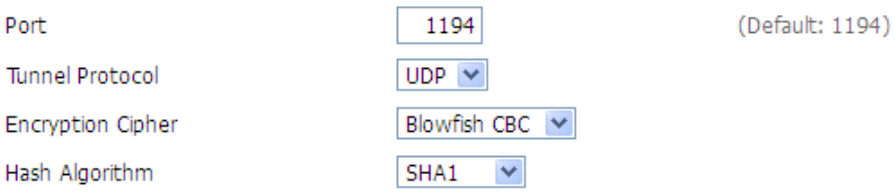
DHCP-Proxy mode: enable or disable DHCP-Proxy mode

Pool starts IP: pool start IP of the client allowed by OPENVPN server

Pool end IP: pool end IP of the client allowed by OPENVPN server

Gateway: the gateway of the client allowed by OPENVPN server

Netmask: netmask of the client allowed by OPENVPN server



Port: listen port of OPENVPN server

Tunnel Protocol: UCP or TCP of OPENVPN tunnel protocol

Encryption Cipher: Blowfish CBC，AES-128 CBC，AES-192 CBC，AES-256 CBC，AES-512 CBC

Hash Algorithm: Hash algorithm provides a method of quick access to data, including SHA1，SHA256，SHA512，MD5

Advanced Options

Use LZO Compression: enable or disable use LZO compression for data transfer

Redirect default Gateway: enable or disable redirect default gateway

Allow Client to Client: enable or disable allow client to client

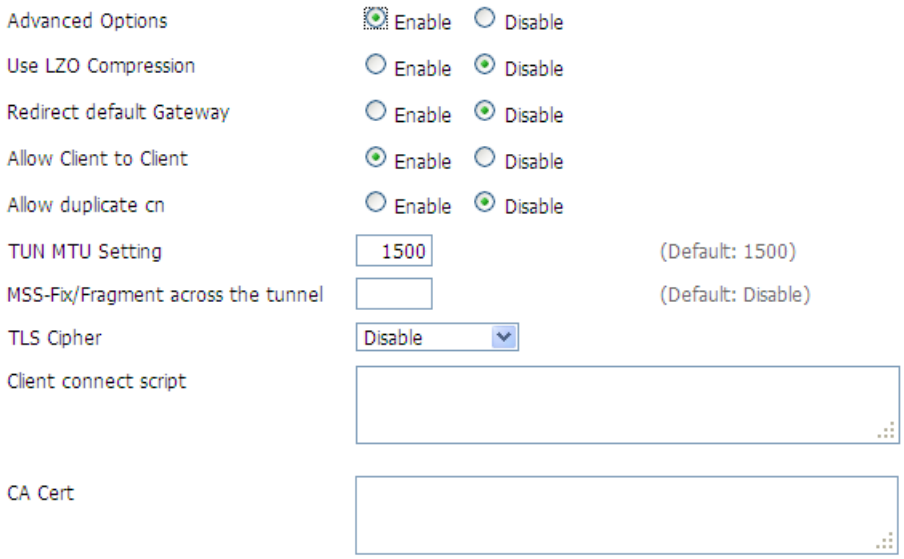
Allow duplicate cn: enable or disable allow duplicate cn

TUN MTU Setting: set the value of TUN MTU

TCP MSS: MSS of TCP data

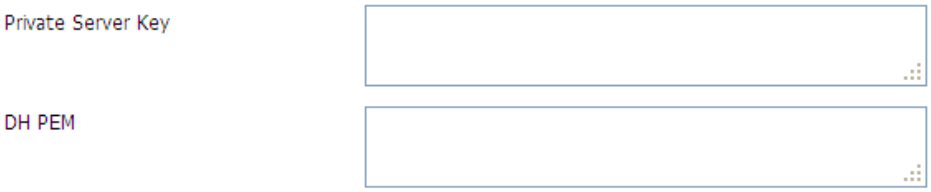
TLS Cipher: TLS (Transport Layer Security) encryption standard supports AES-128 SHA and AES-256 SHA

Client connects script: define some client script by user self



CA Cert: CA certificate

Public Server Cert: server certificate

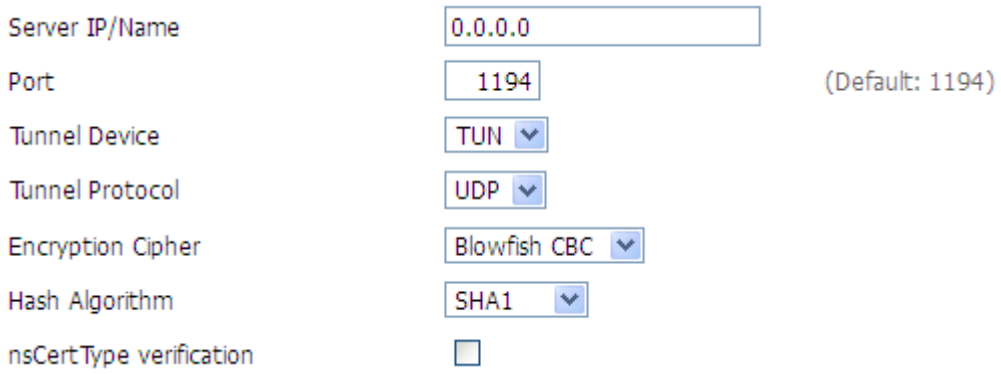


Private Server Key: the key seted by the server

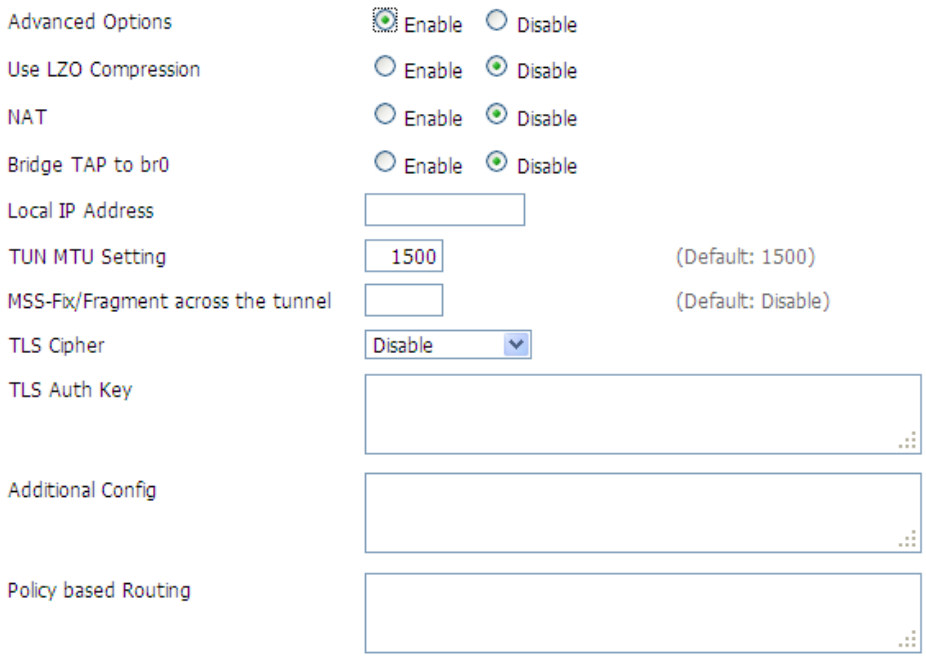
DH PEM: PEM of the server

Additional Config: additional configurations of the server
CCD-Dir DEFAULT file: other file approaches
TLS Auth Key: authority key of Transport Layer Security
Certificate Revoke List: configure some revoke certificates

OPENVPN Client



Server IP/Name: IP address or domain name of OPENVPN server
Port: listen port of OPENVPN client
Tunnel Device: TUN----Cellular Gateway mode, TAP----Bridge mode
Tunnel Protocol: UDP and TCP protocol
Encryption Cipher: Blowfish CBC，AES-128 CBC，AES-192 CBC，AES-256 CBC，AES-512 CBC
Hash Algorithm: Hash algorithm provides a method of quick access to data, including SHA1, SHA256, SHA512, MD5
nsCertType verification: support ns certificate type



Use LZO Compression: enable or disable use LZO compression for data transfer
NAT: enable or disable NAT through function
Bridge TAP to br0: enable or disable bridge TAP to br0
Local IP Address: set IP address of local OPENVPN client
TUN MTU Setting: set MTU value of the tunnel
TCP MSS: mss of TCP data
TLS Cipher: TLS (Transport Layer Security) encryption standard supports AES-128 SHA and AES-256 SHA
TLS Auth Key: authority key of Transport Layer Security
Additional Config: additional configurations of OPENVPN server
Policy based Routing: input some defined routing policy

CA Cert: CA certificate
Public Client Cert: client certificate
Private Client Key: client key

3.3.4.4 IPSEC

Connect Status and Control

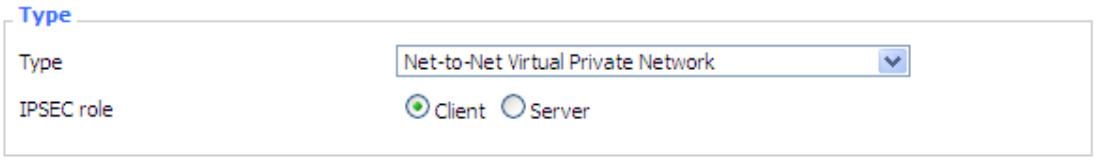
Show IPSEC connection and status of current Cellular Gateway on IPSEC page.

Name: the name of IPSEC connection
Type: The type and function of current IPSEC connection
Common name: local subnet, local address, opposite end address and opposite end subnet of current connection
Status: connection status: closed, negotiating, establish
Closed: this connection does not launch a connection request to opposite end
Negotiating: this connection launches a request to opposite end, is under negotiating, the connection has not been established yet
Establish: the connection has been established, enabled to use this tunnel

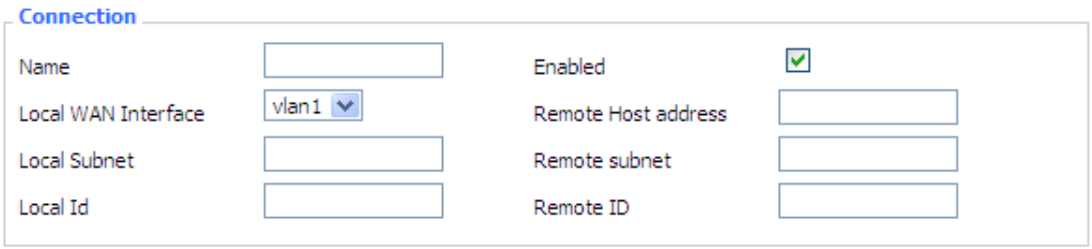
Action: the action of this connection, current is to delete, edit, reconnect, and enable
Delete: to delete the connection, also will delete IPSEC if IPSEC has set up
Edit: to edit the configure information of this connection, reload this connection to make the configuration effect after edit
Reconnect: this action will remove current tunnel, and re-launch tunnel establish request
Enable: when the connection is enabled, it will launch tunnel establish request when the system reboot or reconnect, otherwise the connection will not do it
Add: to add a new IPSEC connection

Add IPSEC connection or edit IPSEC connection

Type: to choose IPSEC mode and relevant functions in this part, supports tunnel mode client, tunnel mode server and transfer mode currently

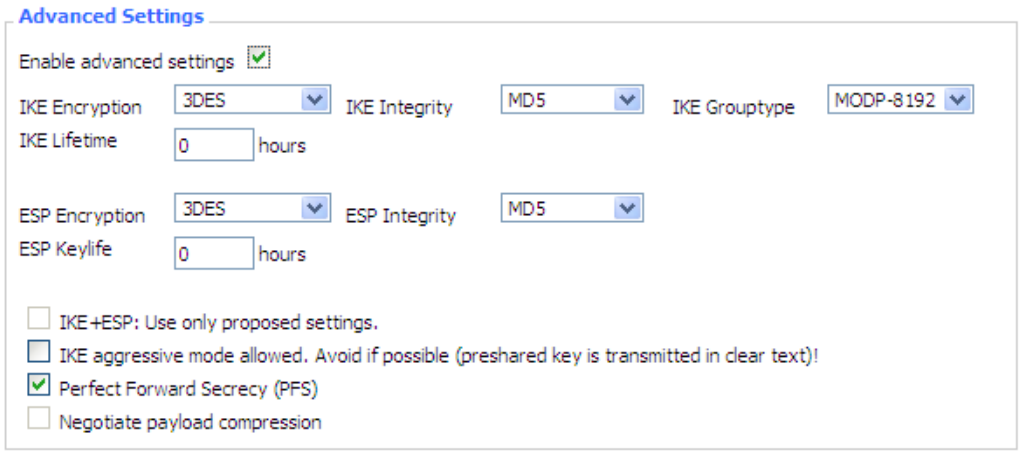


Connection: this part contains basic address information of the tunnel

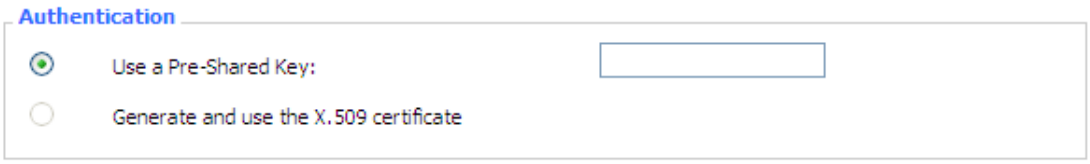


Name: to indicate this connection name, must be unique
Enabled: If enable, the connection will send tunnel connection request when it is reboot or re-connection, otherwise it is no need if disable
Local WAN Interface: local address's of the tunnel
Remote Host Address: IP/domain name of end opposite; this option cannot fill in if using tunnel mode server
Local Subnet: IPSec local protects subnet and subnet mask, i.e., 192.168.1.0/24; this option cannot fill in if using transfer mode
Remote Subnet: IPSec opposite end protects subnet and subnet mask, i.e.,192.168.7.0/24; this option cannot fill in if using transfer mode
Local ID: tunnel local end identification, IP and domain name are available
Remote ID: tunnel opposite end identification, IP and domain name are available
Detection: this part contains configure information of connection detection.

Enable DPD Detection: enable or disable this function, tick means enable
Time Interval: set time interval of connect detection (DPD)
Timeout: set the timeout of connect detection
Action: set the action of connect detection
Advanced Settings: this part contains relevant settings of IKE, ESP, negotiation mode, etc.

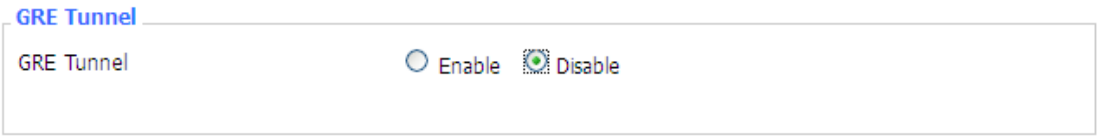


Enable Advanced Settings: enable to configure 1st and 2nd phase information, otherwise it will automic negotiation according to opposite end
IKE Encryption: IKE phased encryption mode
IKE Integrity: IKE phased integrity solution
IKE Group type: DH exchange algorithm
IKE Lifetime: set IKE lifetime, current unit is hour, the default is 0
ESP Encryption: ESP encryption type
ESP Integrity: ESP integrity solution
ESP Key life: set ESP key life, current unit is hour, the default is 0
IKE aggressive mode allowed: negotiation mode adopt aggressive mode if tick; it is main mode if non-tick
Negotiate payload compression: Tick to enable PFS, non-tick to disable PFS
Authentication: choose to use the share encryption option or certificate authentication option. Current is only to choose use the share encryption option.

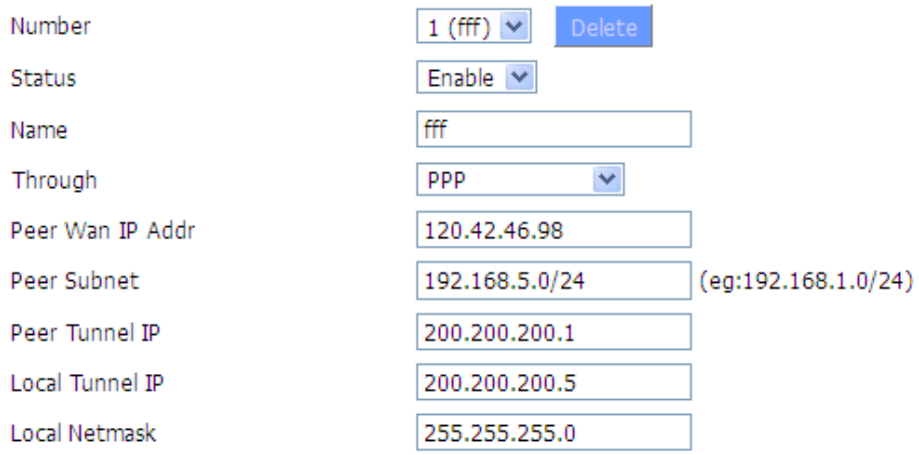


3.3.4.5 GRE

GRE (Generic Routing Encapsulation, Generic Routing Encapsulation) protocol is a network layer protocol (such as IP and IPX) data packets are encapsulated, so these encapsulated data packets to another network layer protocol (IP)transmission. GRE Tunnel (tunnel) technology, Layer Two Tunneling Protocol VPN (Virtual Private Network).

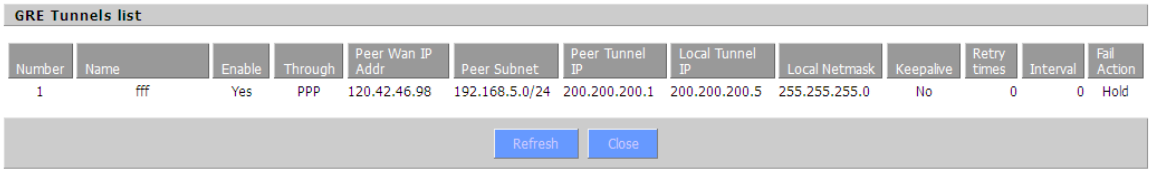


GRE Tunnel: enable or disable GRE function



Number： Switch on/off GRE tunnel app
Status： Switch on/off someone GRE tunnel app
Name： GRE tunnel name
Through： The GRE packet transmit interface
Peer Wan IP Addr： The remote WAN address
Peer Subnet： The remote gateway local subnet, e.g.: 192.168.1.0/24
Peer Tunnel IP： The remote tunnel Ip address
Local Tunnel IP： The local tunnel Ip address
Local Netmask： Netmask of local network

Keepalive Enable or disable GRE Keepalive function
Retry times keepalive detect fail retries
Interval：The time interval of GRE keepalive packet sent
Fail Action：The action would be exec after keeping alive failed
Click on "**View GRE tunnels**" keys can view the information of GRE

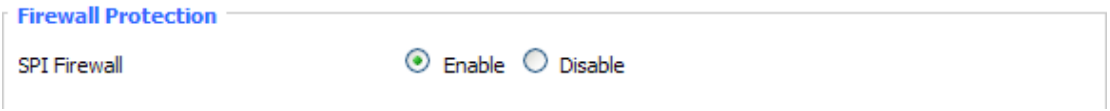


3.3.5 Security

3.3.5.1 Firewall

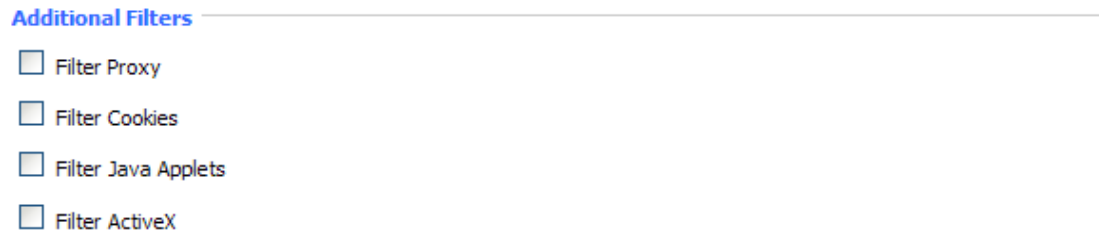
You can enable or disable the firewall, filter specific Internet data types, and prevent anonymous Internet requests, enhance network security.

Firewall Protection



Firewalls enhance network security and use SPI to check the packets into the network. To use firewall protection, choose to enable otherwise disabled. Only enable the SPI firewall, you can use other firewall functions: filtering proxy, block WAN requests, etc.

Additional Filters



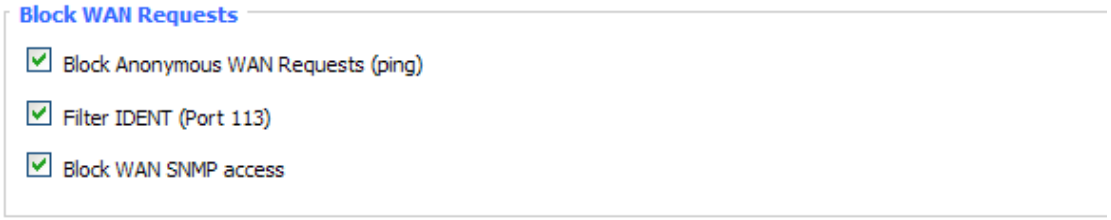
Filter Proxy: Wan proxy server may reduce the security of the gateway; Filtering Proxy will refuse any access to any wan proxy server. Click the check box to enable the function otherwise disabled.

Filter Cookies: Cookies are the website of data stored on your computer. When you interact with the site, the cookies will be used. Click the check box to enable the function otherwise disabled.

Filter Java Applets: If you refuse to Java, you may not be able to open web pages using the Java programming. Click the check box to enable the function otherwise disabled.

Filter ActiveX: If you refuse to ActiveX, you may not be able to open web pages using the ActiveX programming. Click the check box to enable the function otherwise disabled.

Prevent WAN Request



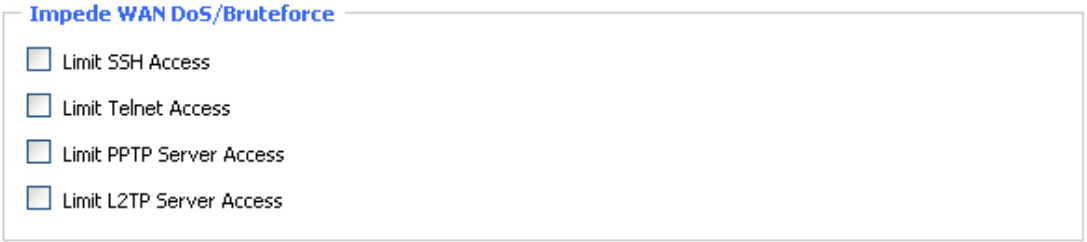
Block Anonymous WAN Requests (ping): By selecting "Block Anonymous WAN Requests (ping)" box to enable this feature, you can prevent your network from the Ping or detection of other Internet users. so that make More difficult to break into your network. The default state of this feature is enabled, choose to disable allow anonymous Internet requests.

Filter IDENT (Port 113): Enable this feature can prevent port 113 from being scanned from outside. Click the check box to enable the function otherwise disabled.

Block WAN SNMP access: This feature prevents the SNMP connection requests from the WAN.

After Complete the changes, click the **Save Settings** button to save your changes. Click the **Cancel Changes** button to cancel unsaved changes.

Impede WAN DoS/Brute force



Limit ssh Access: This feature limits the access request from the WAN by ssh, and per minute up to accept two connection requests on the same IP. Any new access request will be automatically dropped.

Limit Telnet Access: This feature limits the access request from the WAN by Telnet, and per minute up to accept two connection requests on the same IP. Any new access request will be automatically dropped.

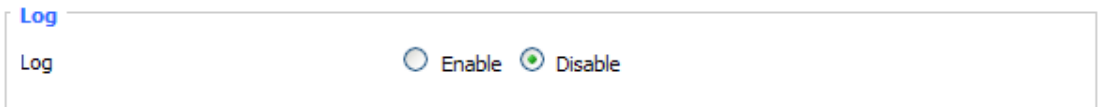
Limit PPTP Server Access: When building a PPTP Server in the Cellular Gateway, this feature limits the access request from the WAN by ssh, and per minute up to accept two

connection requests on the same IP. Any new access request will be automatically dropped.

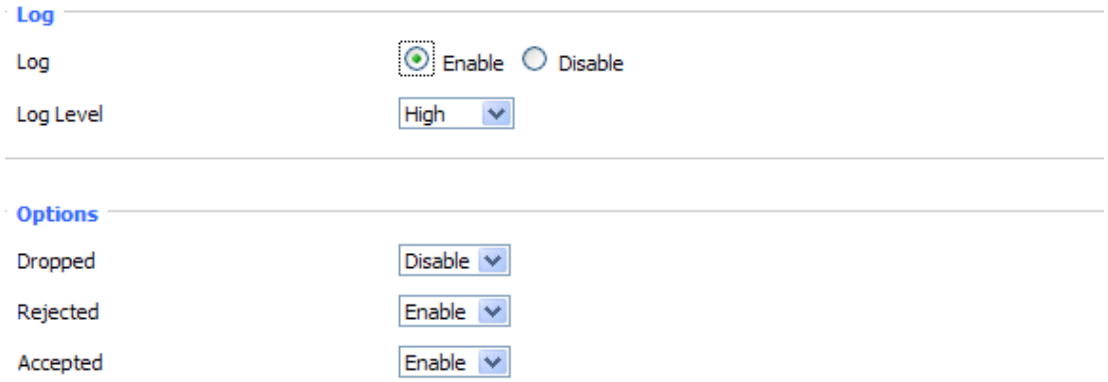
Limit L2TP Server Access: When building an L2TP Server in the Cellular Gateway, this feature limits the access request from the WAN by ssh, and per minute up to accept two connection requests on the same IP. Any new access request will be automatically dropped.

Log Management

The Cellular Gateway can keep logs of all incoming or outgoing traffic for your Internet connection.



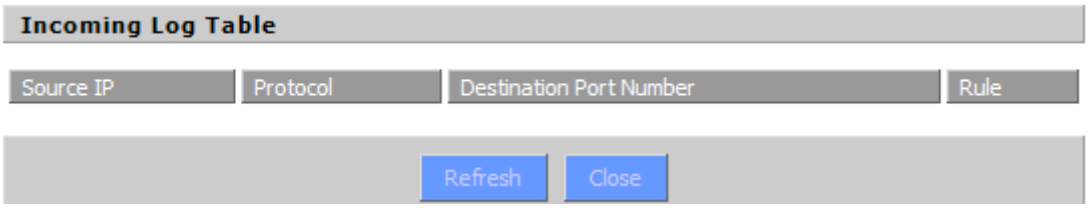
Log: To keep activity logs, select Enable. To stop logging, select Disable. When select enable, the following page will appear.



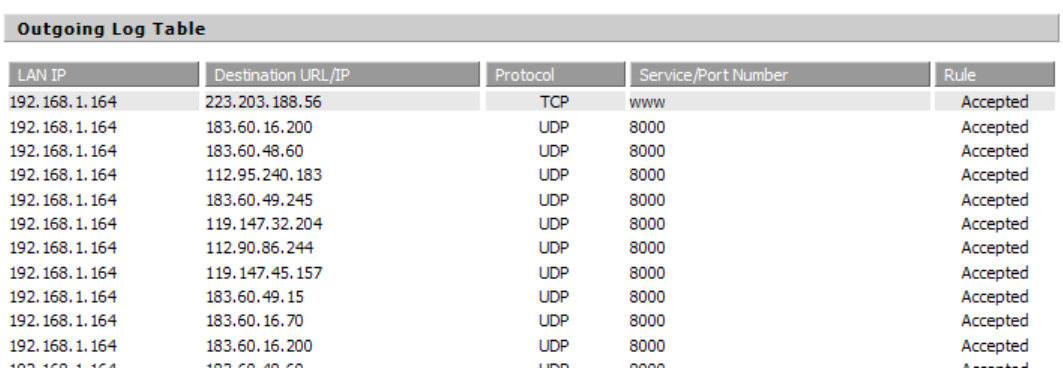
Log Level: Set this to the required log level. Set Log Level higher to log more actions.

Options: When select Enable, the corresponding connection will be recorded in the journal, the disabled are not recorded.

Incoming Log: To see a temporary log of the Cellular Gateway's most recent incoming traffic, click the Incoming Log button.



Outgoing Log: To see a temporary log of the Cellular Gateway's most recent outgoing traffic, click the Outgoing Log button.



Outgoing Log Table

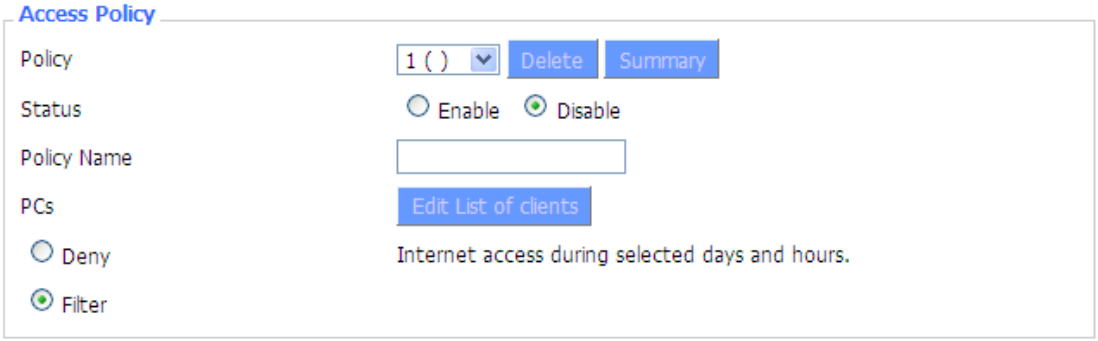
LAN IP	Destination URL/IP	Protocol	Service/Port Number	Rule
192.168.1.164	223.203.188.56	TCP	www	Accepted
192.168.1.164	183.60.16.200	UDP	8000	Accepted
192.168.1.164	183.60.48.60	UDP	8000	Accepted
192.168.1.164	112.95.240.183	UDP	8000	Accepted
192.168.1.164	183.60.49.245	UDP	8000	Accepted
192.168.1.164	119.147.32.204	UDP	8000	Accepted
192.168.1.164	112.90.86.244	UDP	8000	Accepted
192.168.1.164	119.147.45.157	UDP	8000	Accepted
192.168.1.164	183.60.49.15	UDP	8000	Accepted
192.168.1.164	183.60.16.70	UDP	8000	Accepted
192.168.1.164	183.60.16.200	UDP	8000	Accepted

Click the **Save Settings** button to save your changes. Click the **Cancel Changes** button to cancel unsaved changes.

3.3.6 Access Restrictions

3.3.6.1 WAN Access

Use access restrictions, you can block or allow specific types of Internet applications. You can set specific PC-based Internet access policies. This feature allows you to customize up to ten different Internet Access Policies for PCs, which are identified by their IP or MAC addresses.



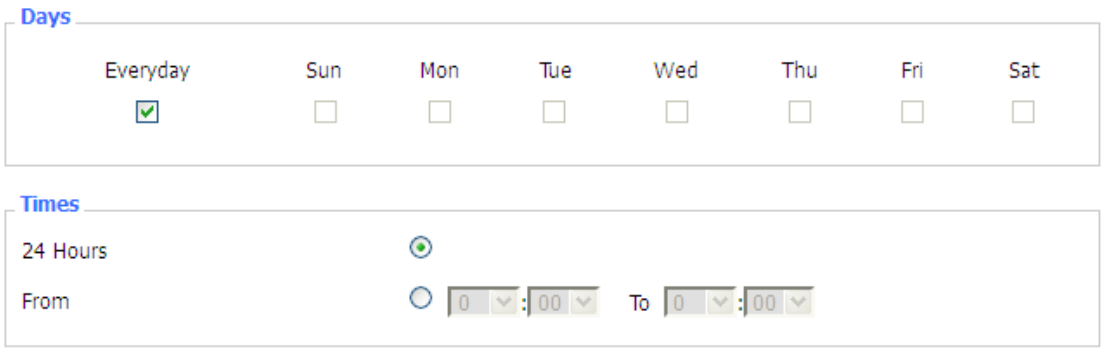
Two options in the default policy rules: "Filter" and "reject". If you select "Deny," you will deny specific computers access to any Internet service at a particular time. If you choose to "filter"， It will block specific computers to access the specific sites at a specific time. You can set up 10 Internet access policies filtering specific PCs access Internet services at a particular time.

Access Policy: You may define up to 10 access policies. Click Delete to delete a policy or Summary to see a summary of the policy.

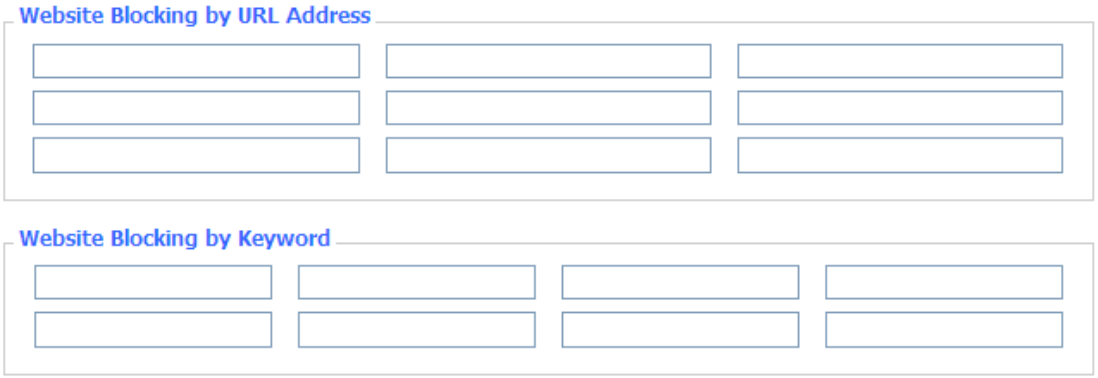
Status: Enable or disable a policy.

Policy Name: You may assign a name to your policy.

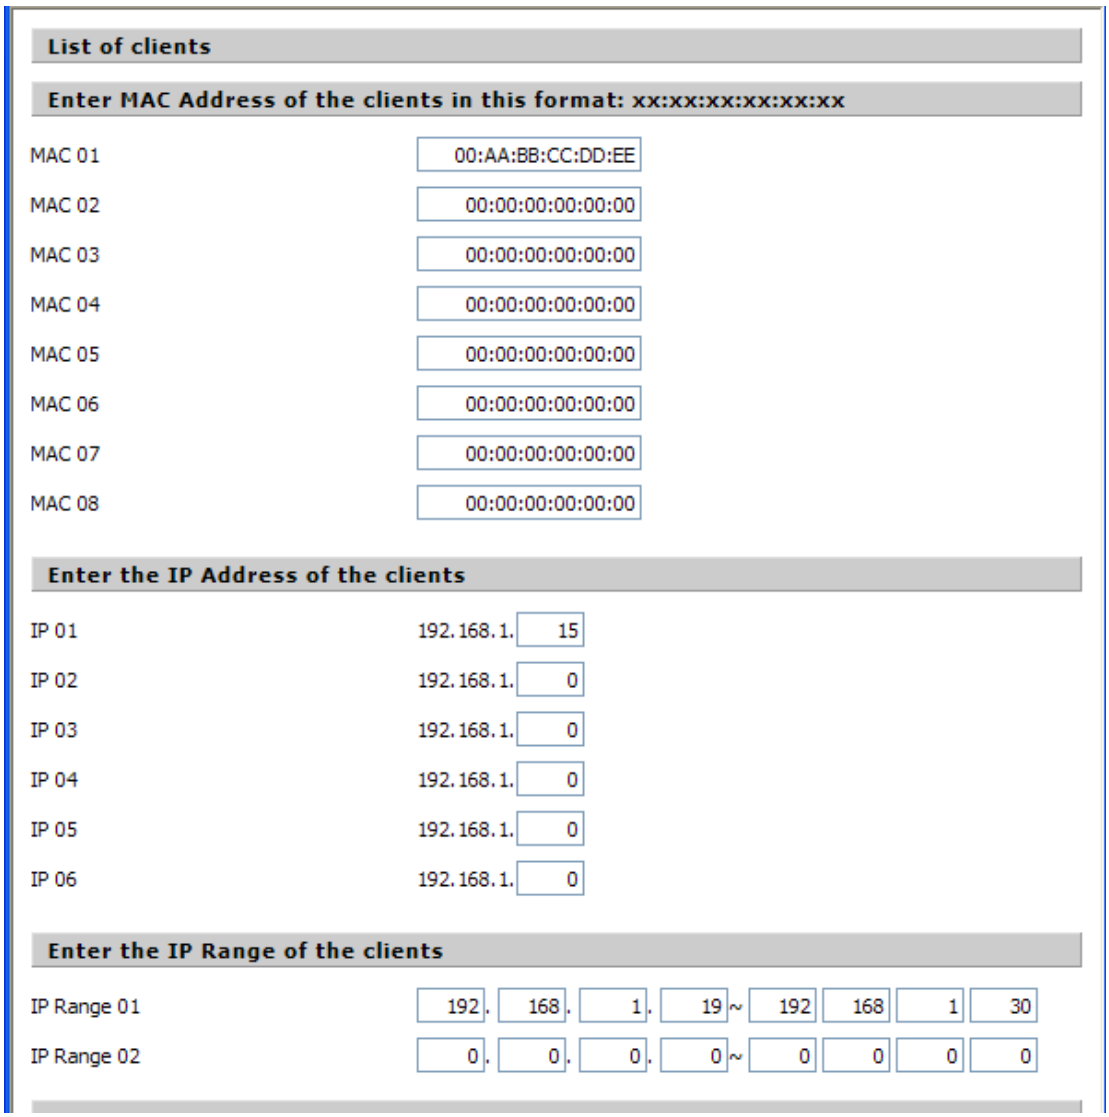
PCs: The part is used to edit client list; the strategy is only effective for the PC in the list.



Days: Choose the day of the week you would like your policy to be applied.
Times: Enter the time of the day you would like your policy to be applied.



Website Blocking by URL Address: You can block access to certain websites by entering their URL.
Website Blocking by Keyword: You can block access to certain website by the keywords contained in their webpage.



set up Internet access policy

1. Select the policy number (1-10) in the drop-down menu.
2. For this policy is enabled, click the radio button next to "Enable"
3. Enter a name in the Policy Name field.
4. Click the Edit List of PCs button.
5. On the List of PCs screen, specify PCs by IP address or MAC address. Enter the appropriate IP addresses into the IP fields. If you have a range of IP addresses to filter, complete the appropriate IP Range fields. Enter the appropriate MAC addresses into the MAC fields.
6. Click the Apply button to save your changes. Click the Cancel button to cancel your unsaved changes. Click the Close button to return to the Filters screen.
7. If you want to block the listed PCs from Internet access during the designated days and time, then keep the default setting, Deny. If you want the listed PCs to have Internet filtered during the designated days and time, then click the radio button next to Filter.

8. Set the days when access will be filtered. Select Every day or the appropriate days of the week.
9. Set the time when access will be filtered. Select 24 Hours or check the box next to From and use the drop-down boxes to designate a specific time.
10. Click the Add to Policy button to save your changes and activate it.
11. To create or edit additional policies, repeat steps 1-9.
12. To delete an Internet Access Policy, select the policy number, and click the Delete button.

Note:

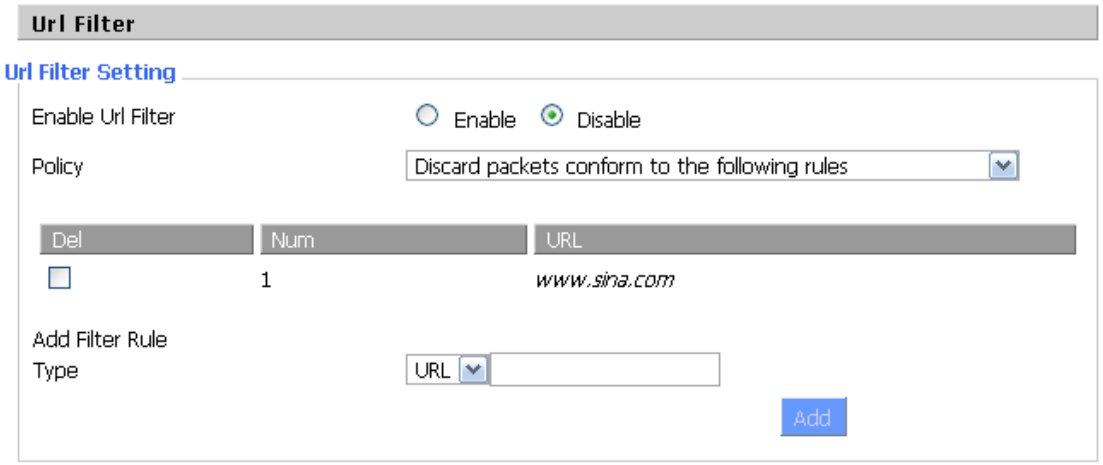
3.3.3.1 The default factory value of policy rules is "filtered". If the user chooses the default policy rules for "refuse" and editing strategies to save or directly to save the settings. If the strategy edited is the first, it will be automatically saved into the second, if not the first, keep the original number.

3.3.3.2 Turn off the power of the Cellular Gateway or reboot the Cellular Gateway can cause a temporary failure After the failure of the Cellular Gateway, if cannot automatically synchronized NTP time server, you need to recalibrate to ensure the correct implementation of the relevant period control functions.

3.3.6.2 URL Filter

If you want to prevent certain client access to specific network domain name, such as www.sina.com. We can achieve it through the function of URL filter.

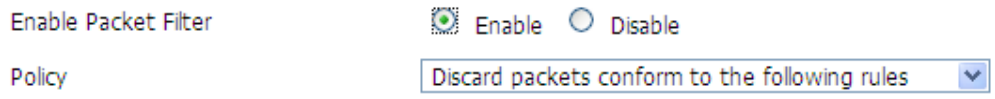
URL filtering function



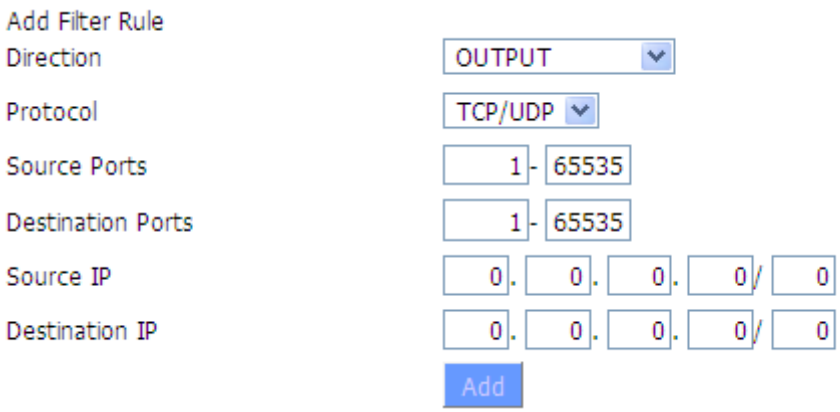
Discard packets conform to the following rules: only discard the matching URL address in the list.
Accept only the data packets conform to the following rules: receive only with custom rules of network address, discarded all other URL address.

3.3.6.3 Packet Filter

To block some packets getting Internet access or block some Internet packets getting local network access, you can configure filter items to block these packets.
Packet Filter
Packet filter function is realized based on IP address or port of packets.



Enable Packet Filter: Enable or disable “packet filter” function
Policy: The filter rule’s policy, you can choose the following options
Discard The Following--Discard packets conform to the following rules, Accept all other packets Only Accept the Following-- Accept only the data packets conform to the following rules, Discard all other packets



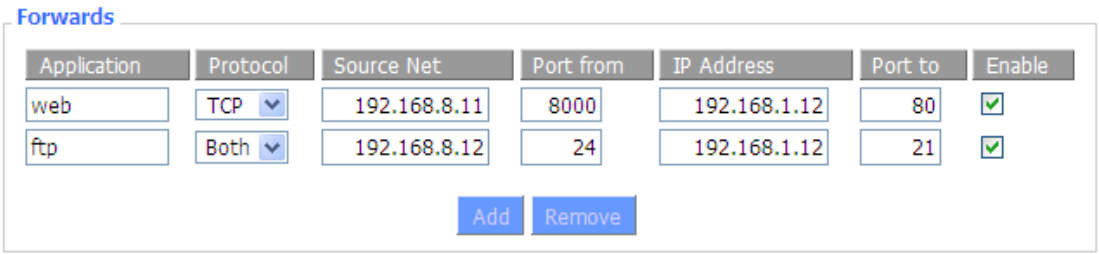
Direction
input: packet from WAN to LAN
output: packet from LAN to WAN
Protocol : packet Protocol type
Source Ports : packet's source port
Destination Ports : packet's destination port
Source IP: packet's source IP address
Destination IP: packet's destination IP address

Note: "Source Port", "Destination Port", "Source IP", "Destination IP" could not be empty; you must input at least one of these four parameters.

3.3.7 NAT

3.3.7.1 Port Forwarding

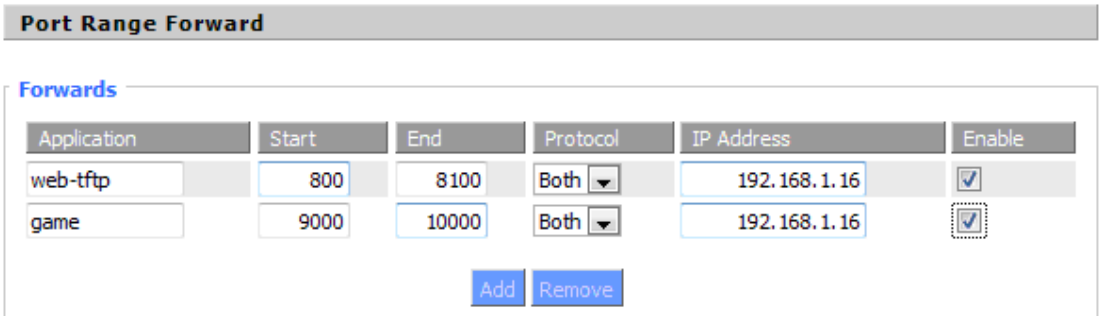
Port Forwarding allows you to set up public services on your network, such as web servers, ftp servers, e-mail servers, or other specialized Internet applications. Specialized Internet applications are any that use Internet access to perform functions like videoconferencing or online gaming. When users send this type of request to your network via the Internet, the Cellular Gateway will forward those requests to the appropriate PC. If you want to forward an entire range of ports, see Port Range Forwarding.



Application: Enter the name of the application in the field provided.
Protocol: Chose the right protocol TCP, UDP or Both. Set this to what the application requires.
Source Net: Forward only if sender matches this Ip/net (example 192.168.1.0/24).
Port from: Enter the number of the external port (the port number seen by users on the Internet).
IP Address: Enter the IP Address of the PC running the application.
Port to: Enter the number of the internal port (the port number used by the application).
Enable: Click the Enable checkbox to enable port forwarding for the application.
Check all values and click **Save Settings** to save your settings. Click the **Cancel changes** button to cancel your unsaved changes.

3.3.1.1 Port Range Forward

Port Range Forwarding allows you to set up public services on your network, such as web servers, ftp servers, e-mail servers, or other specialized Internet applications. Specialized Internet applications are any that use Internet access to perform functions like videoconferencing or online gaming. When users send this type of request to your network via the Internet, the Cellular Gateway will forward those requests to the appropriate PC. If you only want to forward a single port, see Port Forwarding.

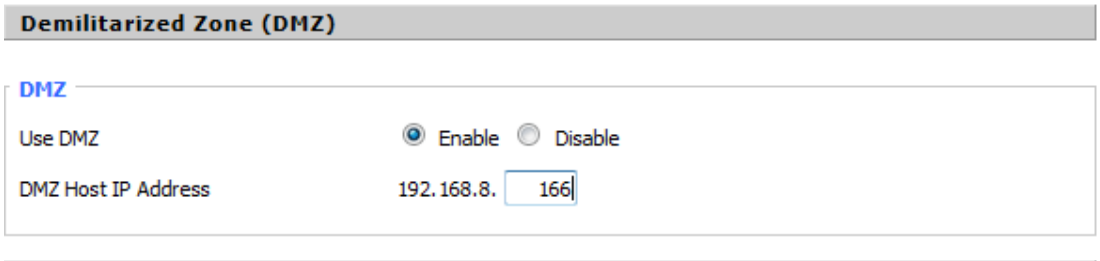


Application: Enter the name of the application in the field provided.
Start: Enter the number of the first port of the range you want to see by users on the Internet and forward it to your PC.
End: Enter the number of the last port of the range you want to see by users on the Internet and forward it to your PC.
Protocol: Chose the right protocol TCP, UDP or Both. Set this to what the application requires.
IP Address: Enter the IP Address of the PC running the application.
Enable: Click the Enable checkbox to enable port forwarding for the application.
Check all values and click **Save Settings** to save your settings. Click the **Cancel changes** button to cancel your unsaved changes.

3.3.1.2 DMZ

The DMZ (Demilitarized Zone) hosting feature allows one local user to be exposed to the Internet for use of a special-purpose service like Internet gaming or videoconferencing. DMZ hosting forwards all the ports at the same time to one PC. The Port Forwarding feature is

more secure because it only opens the ports you want to have opened, while DMZ hosting opens all the ports of one computer, exposing the computer so the Internet can see it.



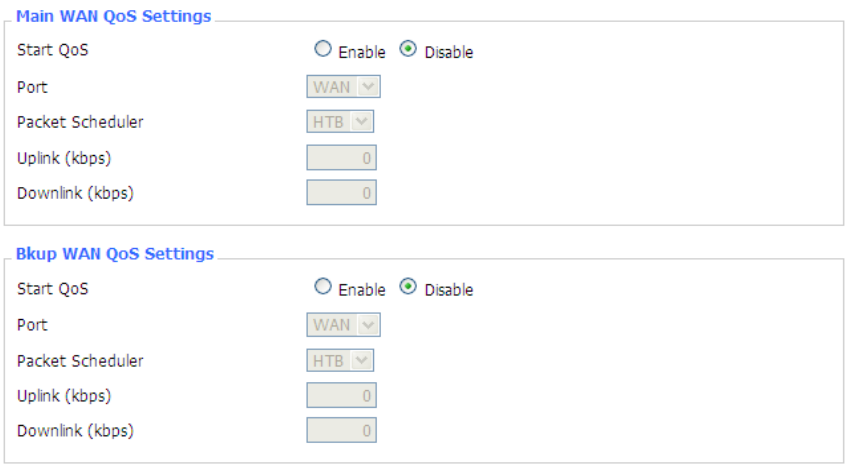
Any PC whose port is being forwarded must have a new static IP address assigned to it because its IP address may change when using the DHCP function.
DMZ Host IP Address: To expose one PC to the Internet, select Enable and enter the computer's IP address in the DMZ Host IP Address field. To disable the DMZ, keep the default setting Disable Check all values and click **Save Settings** to save your settings.

Click the **Cancel changes** button to cancel your unsaved changes.

3.3.8 QoS Setting

3.3.8.1 Basic

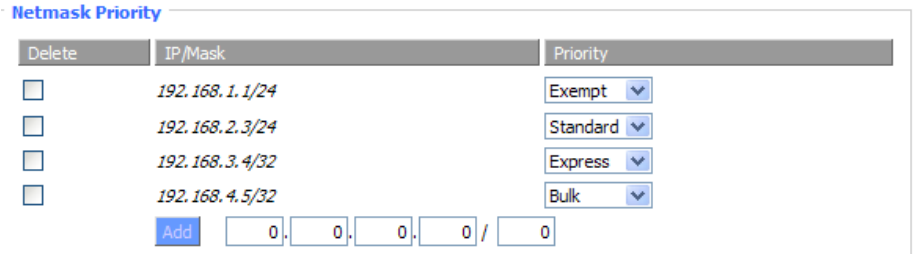
Bandwidth management prioritizes the traffic on your Cellular Gateway. Interactive traffic (telephony, browsing, telnet, etc.) gets priority and bulk traffic (file transfer, P2P) gets low priority. The main goal is to allow both types to live side-by side without unimportant traffic disturbing more critical things. All of this is automatic.
QoS allows control of the bandwidth allocation to different services, netmasks, MAC addresses and the four LAN ports.



Uplink (kbps)： In order to use bandwidth management (QoS) you must enter bandwidth values for your uplink. These are 80% to 90% of your maximum bandwidth.
Downlink (kbps)： In order to use bandwidth management (QoS) you must enter bandwidth values for your downlink. These are 80% to 90% of your maximum bandwidth.

3.3.8.2 Classify

Netmask Priority



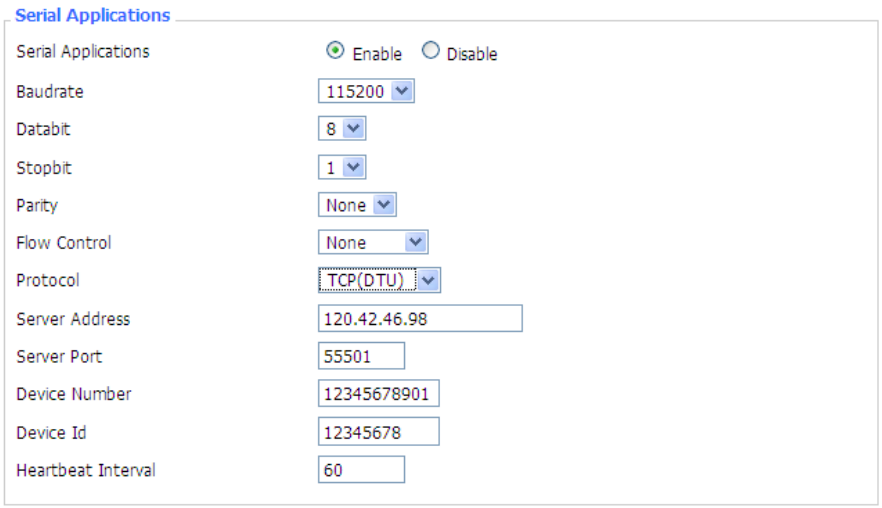
You may specify priority for all traffic from a given IP address or IP Range.

Check all values and click **Save Settings** to save your settings. Click the **Cancel changes** button to cancel your unsaved changes.

3.3.9 Applications

3.3.9.1 Serial Applications

There is a console port on Cellular Gateway. Normally, this port is used to debug the Cellular Gateway. This port can also be used as a serial port. The Cellular Gateway has embedded a serial to TCP program. The data sent to the serial port is encapsulated by TCP/IP protocol stack and then is sent to the destination server. This function can work as a DTU (Data Terminal Unit).



Baud rate: Baud rate indicates the number of bytes per second transported by device, commonly used baud rate is115200, 57600, 38400, 19200.

Data bit: the data bits can be 4, 5, 6, 7, 8, constitute a character. The ASCII code is usually used. Starting from the most significant bit is transmitted,

Stop bit: it marks the end of a character data. It is a high level of 1, 1.5, 2.

Parity: use a set of data to check the data error.

Flow control: including the hardware part and software part in two ways.

Enable Serial TCP Function: Enable the serial to TCP function
Protocol Type: The protocol type to transmit data.
UDP(DTU) – Data transmit with UDP protocol, work as a San Telequip IP MODEM device which has application protocol and hear beat mechanism.
Pure UDP – Data transmitted with standard UDP protocol.
TCP(DTU) -- Data transmit with TCP protocol, work as a San Telequip P MODEM device which has application protocol and hear beat mechanism.

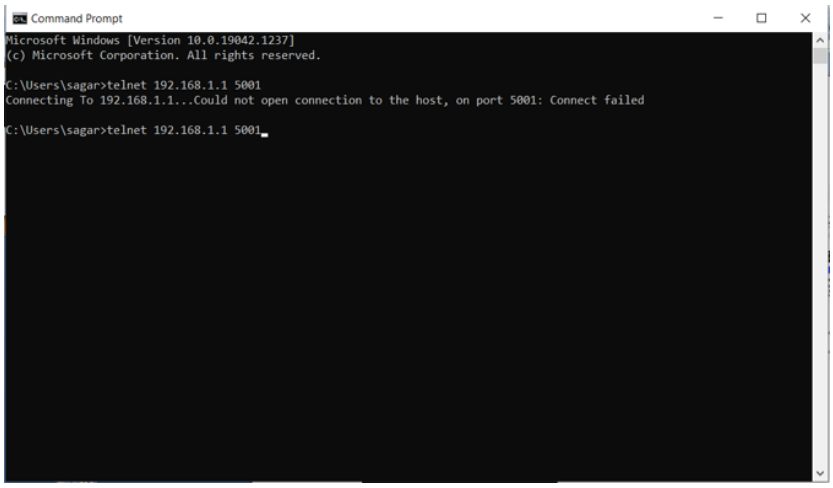
Pure TCP -- Data transmitted with standard TCP protocol; Cellular Gateway is the client.
TCP Server -- Data transmitted with standard TCP protocol; Cellular Gateway is the server.
Telnet SMS: Enable to send SMS via AT Commands.
Server Address: The data service center's IP Address or domain name.
Server Port: The data service center's listening port.
Device ID: The Cellular Gateway's identity ID.
Device Number: The Cellular Gateway's phone number.
Heartbeat Interval: The time interval to send heartbeat packet. This item is valid only when you choose UDP(DTU) or TCP(DTU) protocol type.
TCP Server Listen Port: This item is valid when Protocol Type is "TCP Server"

3.9.3.2 SMS By Telnet

Enable Serial application to Telnet SMS as shown in below screenshot.

Open Command Prompt and put command telnet 192.168.1.1 5001
Telnet 192.168.1.1 5001

San Telequip (P) Ltd.,
504 & 505 Deron Heights, Baner Road
Pune 411045, India
Phone : +91-20-27293455, 9764027070, 8390069393
email : info@santelequip.com



Send AT commands
Then send +++ to enter
AT status.
AT+cmgf=1
AT+CMGS=" number"
It will show >,
Put the SMS content Press CTRL+Z
at same time to send SMS. Send --- to exit AT status if no need to send SMS

3.3.10 Administration

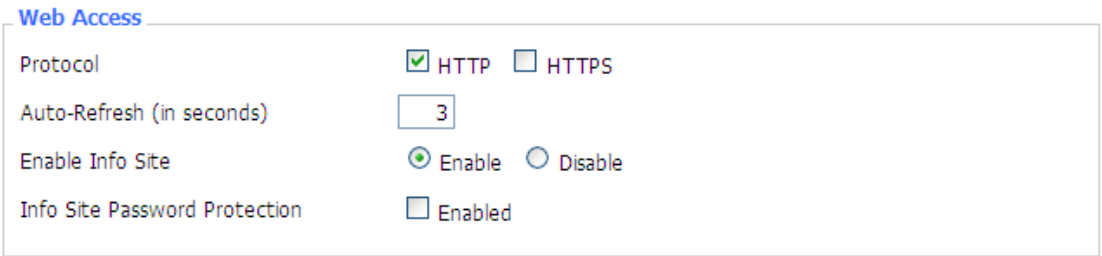
3.3.10.1 Management

The Management screen allows you to change the Cellular Gateway's settings. On this page you will find most of the configurable items of the Cellular Gateway code.

The new password must not exceed 32 characters in length and must not include any spaces. Enter the new password a second time to confirm it.

Note:
The default username is admin.
It is strongly recommended that you change the factory default password of the Cellular Gateway, which is admin. All users who try to access the Cellular Gateway's web-based utility or Setup Wizard will be prompted for the Cellular Gateway's password.

Web Access
This feature allows you to manage the Cellular Gateway using either HTTP protocol or the HTTPS protocol. If you choose to disable this feature, a manual reboot will be required. You can also activate or not the Cellular Gateway information web page. It is now possible to password protect this page (same username and password as above).

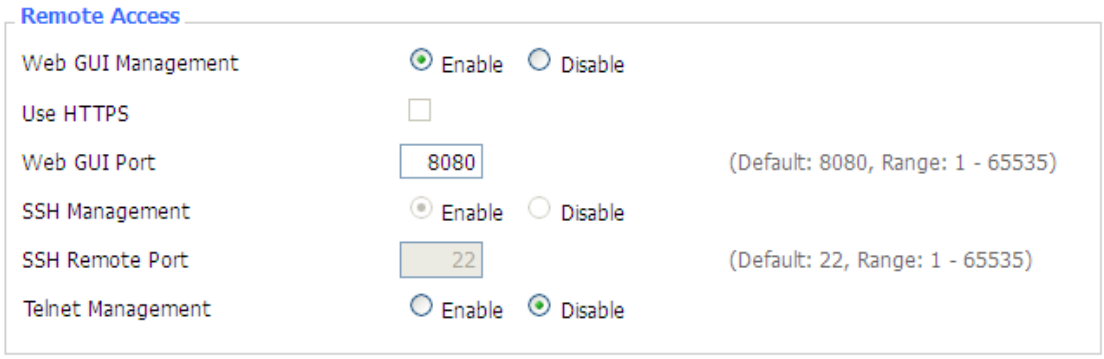


Protocol This feature allows you to manage the Cellular Gateway using either HTTP protocol or the HTTPS protocol

Auto-Refresh： Adjusts the Web GUI automatic refresh interval. 0 disables this feature completely

Enable Info Site： Enable or disable the login system information page

Info Site Password Protection ： Enable or disable the password protection feature of the system information page



Remote Access This feature allows you to manage the Cellular Gateway from a remote location via the Internet. To disable this feature, keep the default setting, Disable. To enable this feature, select Enable, and use the specified port (default is 8080) on your PC to remotely manage the Cellular Gateway. You must also change the Cellular Gateway's default password to one of your own if you have not already.

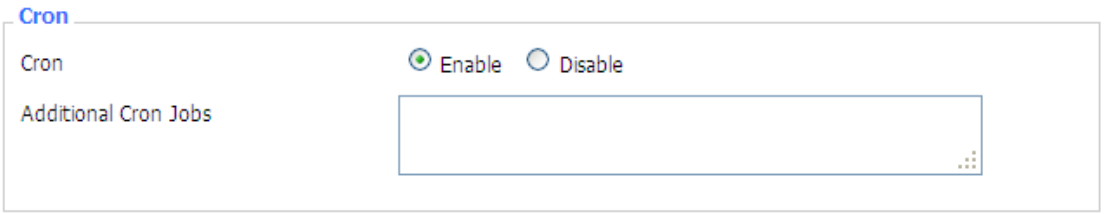
To remotely manage the Cellular Gateway, enter http://xxx.xxx.xxx.xxx:8080 (the x's represent the Cellular Gateway's Internet IP address, and 8080 represents the specified

port) in your web browser's address field. You will be asked for the Cellular Gateway's password. If you use https you need to specify the URL as https://xxx.xxx.xxx.xxx:8080 (not all firmware does support this without rebuilding with SSL support).

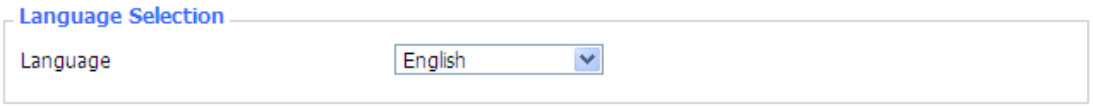
SSH Management You can also enable SSH to remotely access the Cellular Gateway by Secure Shell. Note that SSH daemon needs to be enabled in Services page.

Note：If the Remote Cellular Gateway Access feature is enabled, anyone who knows the Cellular Gateway's Internet IP address and password will be able to alter the Cellular Gateway's settings.

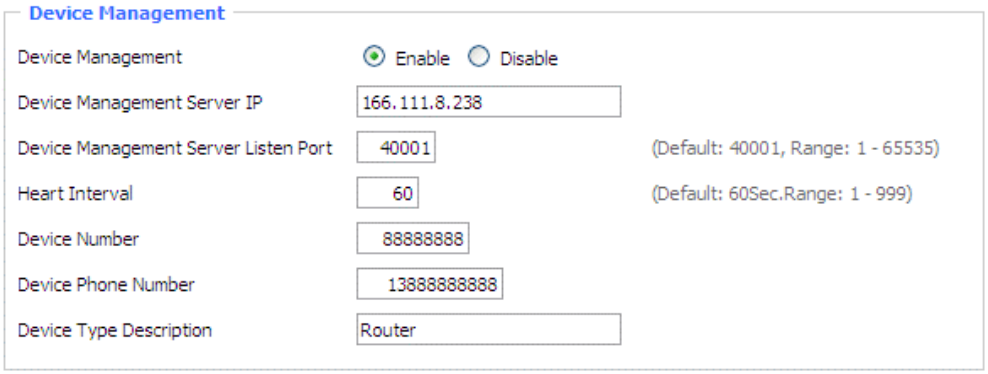
Telnet Management Enable or disable remote Telnet function



Cron：The cron subsystem schedules execution of Linux commands. You will need to use the command line or startup scripts to use this.



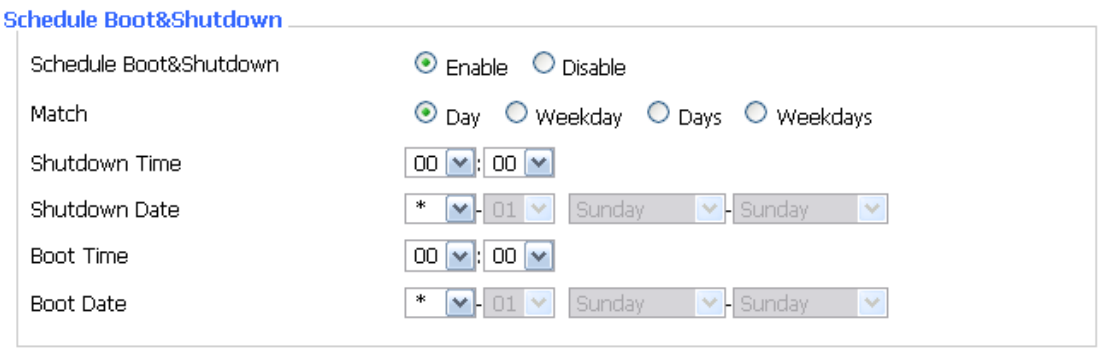
Language：Set up the Cellular Gateway page shows the type of language, including simplified Chinese and English.



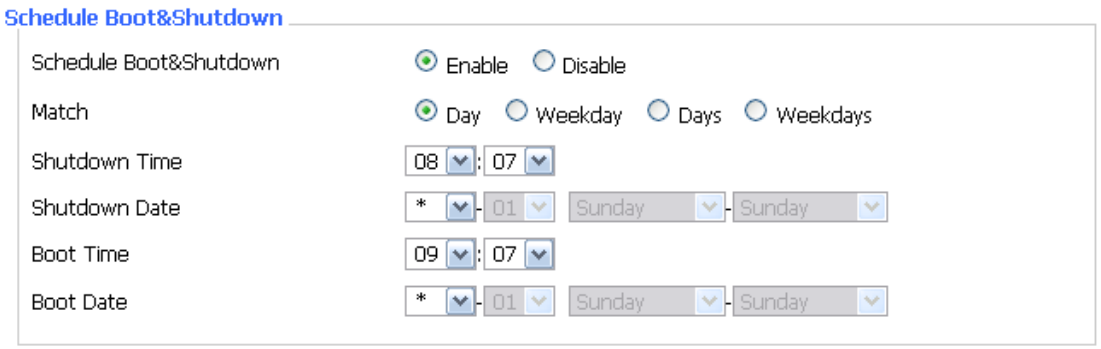
Remote Upgrade: custom-developed remote management server for this station Cellular Gateway monitoring and management, configuration parameters, WIFI advertising updates.

3.3.10.2 Keep Alive

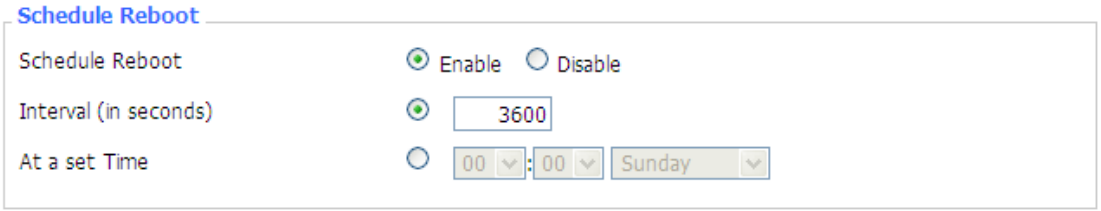
Schedule Boot & Shutdown



The user can set the startup or shutdown time:
For example, the user wants to set the start time to 8:07 and boot time to 9:07.



Schedule Reboot



You can schedule regular reboots for the Cellular Gateway:

Regularly after xxx seconds.

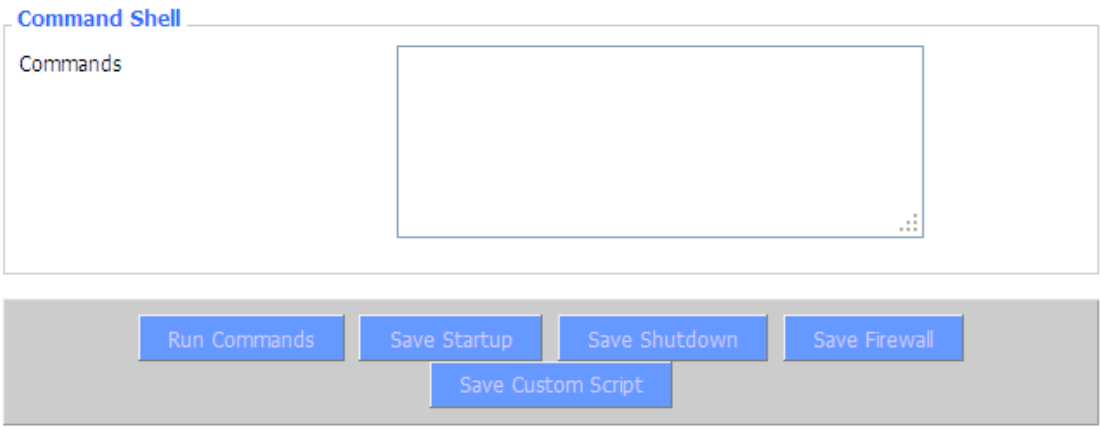
At a specific date time each week or every day.

Note:

For date-based reboots Cron must be activated. See Management for Cron activation.

3.3.10.3 Commands

Commands: You can run command lines directly via the Web interface.



Run Command： You can run command lines via the web interface. Fill the text area with your command and click Run Commands to submit.

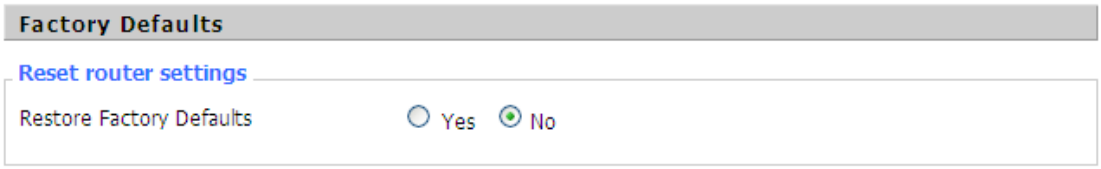
Startup： You can save some command lines to be executed at startup's Cellular Gateway. Fill the text area with commands (only one command per row) and click Save Startup.

Shutdown： You can save some command lines to be executed at shutdown's Cellular Gateway. Fill the text area with commands (only one command per row) and click Save Shutdown.

Firewall： Each time the firewall is started, it can run some custom iptables instructions. Fill the text area with firewall's instructions (only one command by row) and click Save Firewall.

Custom Script： Custom script is stored in /tmp/custom.sh file. You can run it manually or use corn to call it. Fill the text area with script's instructions (only one command by row) and click Save Custom Script.

3.3.10.4 Factory Defaults

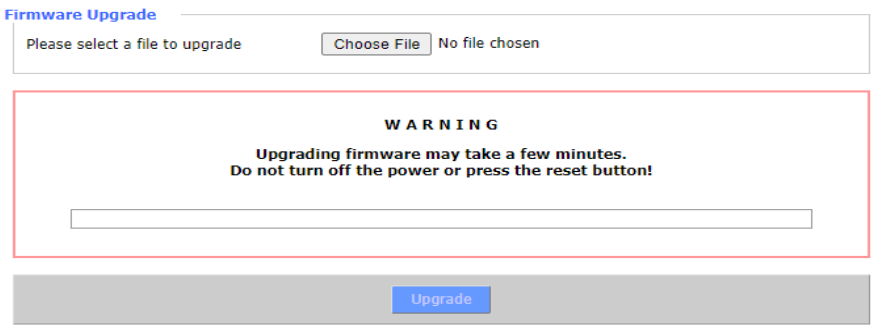


Reset Cellular Gateway settings： Click the Yes button to reset all configuration settings to their default values. Then click the Apply Settings button.

Note：

Any settings you have saved will be lost when the default settings are restored. After restoring the Cellular Gateway is accessible under the default IP address 192.168.1.1 and the default password admin.

3.3.10.5 Firmware Upgrade



Firmware Upgrade： New firmware versions are posted at www.com and can be downloaded. If the Cellular Gateway is not experiencing difficulties, then there is no need to

download a more recent firmware version, unless that version has a new feature that you want to use.

Note： When you upgrade the Cellular Gateway's firmware, you lose its configuration settings, so make sure you write down the Cellular Gateway settings before you upgrade its firmware.

To upgrade the Cellular Gateway's firmware:

1. Download the firmware upgrade file from the website.
2. Click the Browse... button and chose the firmware upgrade file.
3. Click the Upgrade button and wait until the upgrade is finished.

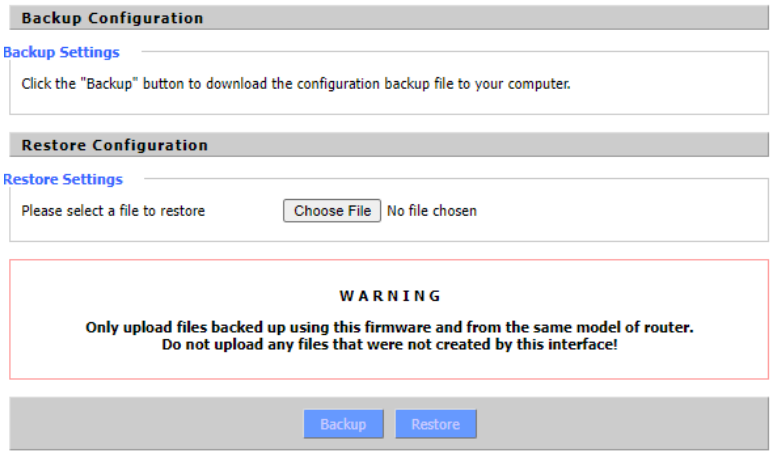
Note：

Upgrading firmware may take a few minutes.

Do not turn off the power or press the reset button!

After flashing, reset to： If you want to reset the Cellular Gateway to the default settings for the firmware version you are upgrading to, click the Firmware Defaults option.

3.3.10.6 Backup



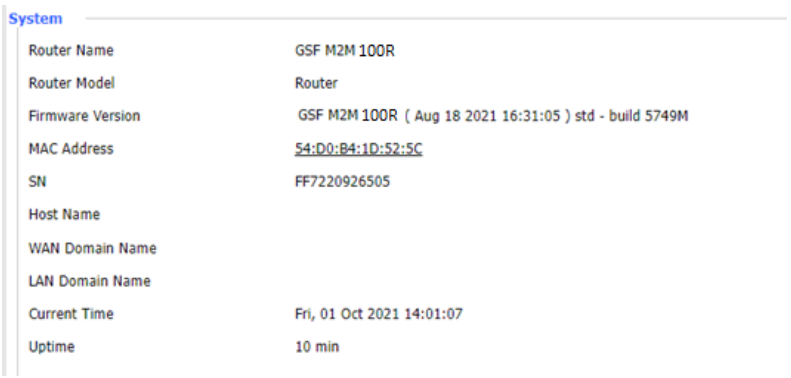
Backup Settings： You may backup your current configuration in case you need to reset the Cellular Gateway back to its factory default settings. Click the Backup button to back up your current configuration.

Restore Settings： Click the Browse... button to browse for a configuration file that is currently saved on your PC. Click the Restore button to overwrite all current configurations with the ones in the configuration file.

Note： Only restore configurations with files backed up using the same firmware and the same model of Cellular Gateway.

3.3.11 Status

3.3.11.1 Cellular Gateway



Cellular Gateway Name: name of the Cellular Gateway, setting→basic setting to modify
Cellular Gateway Model: model of the Cellular Gateway, unavailable to modify
Firmware Version: software version information
MAC Address: MAC address of WAN, setting→Clone MAC Address to modify
Host Name: host name of the Cellular Gateway, setting→basic setting to modify
WAN Domain Name: domain name of WAN, setting→basic setting to modify
LAN Domain Name: domain name of LAN, unavailable to modify
Current Time: local time of the system
Uptime: operating uptime if the system is powered on

Total Available: the room for total available of RAM (that is physical memory minus some reserve and the kernel of binary code bytes)

Free: free memory, the Cellular Gateway will reboot if the memory is less than 500kB

Used: used memory, total available memory minus free memory

Buffers: used memory for buffers,

Cached: the memory used by high-speed cache memory

Active: active use of buffer or cache memory page file size

Inactive: not often used in a buffer or cache memory page file size

Active IP Connections: total active IP connections

Protocol: connection protocol

Timeouts: connection timeouts, unit is second

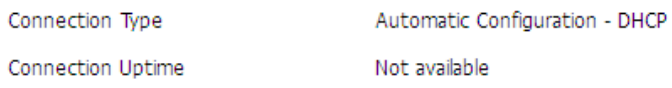
Source Address: source IP address

Remote Address: remote IP address

Service Name: connecting service port

Status: displayed status

3.3.11.2 WAN



Connection Type: disabled, static IP, automatic configuration-DHCP, PPPOE, PPTP, L2TP, 3G/UMTS

Connection Uptime: connecting uptime; If disconnect, display Not available

IP Address	0.0.0.0
Subnet Mask	0.0.0.0
Gateway	0.0.0.0
DNS 1	
DNS 2	
DNS 3	

IP Address: IP address of Cellular Gateway WAN

Subnet Mask: subnet mask of Cellular Gateway WAN

Gateway: the gateway of Cellular Gateway WAN

DNS1, DNS2, DNS3: DNS1/DNS2/DNS3 of Cellular Gateway WAN

Remaining Lease Time	0 days 23:38:43
	DHCP Release DHCP Renew

Remaining Lease Time: remaining lease time of IP address in DHCP way

DHCP Release: release DHCP address

DHCP Renew: renew IP address in DHCP way, default is 1 day

Login Status	Disconnected Connect

Login Status: connection status of WAN

Disconnection: disconnect

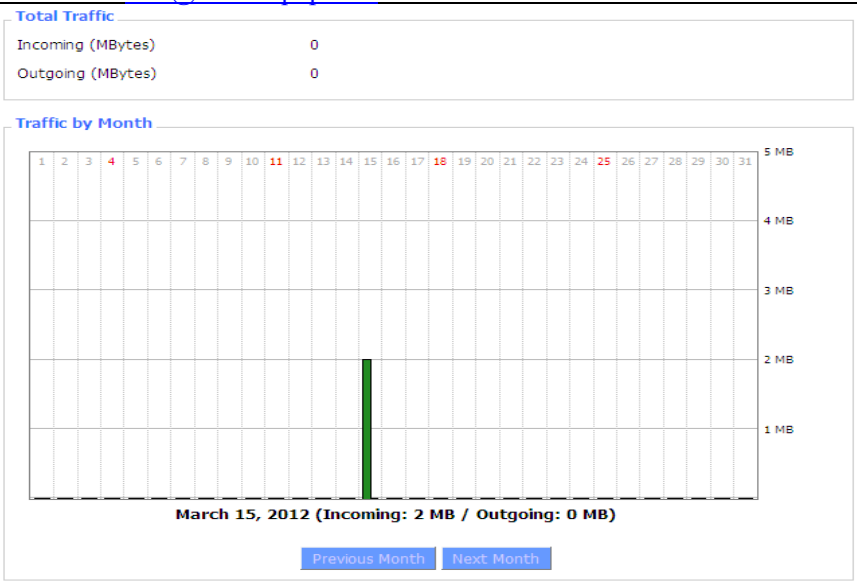
Connection: connect

Module Type	ZTE-EVDO MODULE
Signal Status	-79 dBm
Network	CDMA/HDR

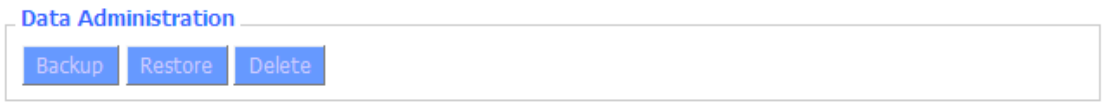
Module Type: module type in 3G/UMTS way

Signal Status: signal intensity of the module in 3G/UMTS way

Network: network type of the module in 3G/UMTS way

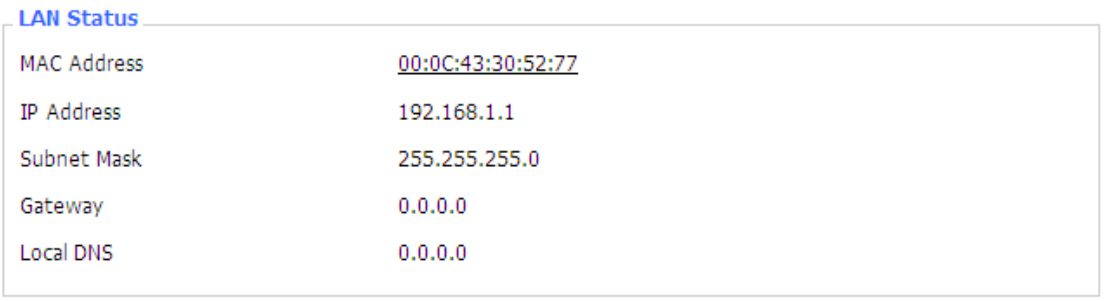


Total Flow: flow from power-off last time until now statistics, download and upload direction
Monthly Flow: the flow of a month, unit is MB
Last Month: the flow of last month
Next Month: the flow of next month



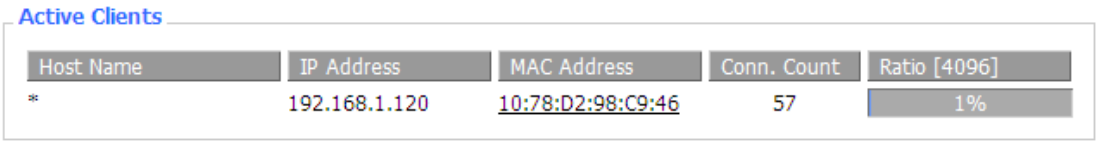
Backup: backup data administration
Restore: restore data administration
Delete: delete data administration

3.3.11.3 LAN

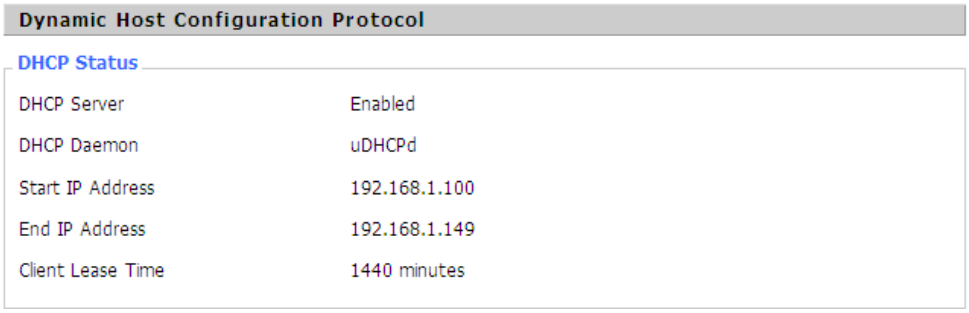


MAC Address: MAC Address of the LAN port ethernet
IP Address: IP Address of the LAN port
Subnet Mask: Subnet Mask of the LAN port

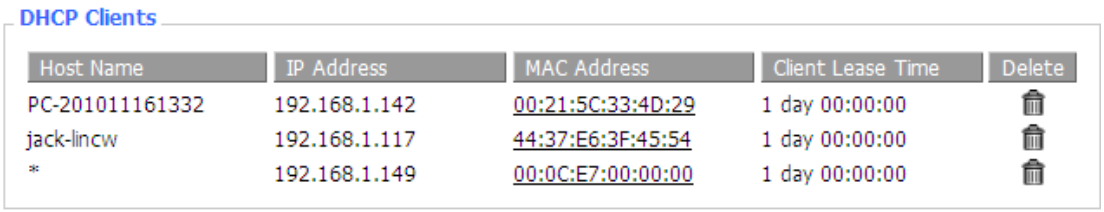
Gateway: Gateway of the LAN port
Local DNS: DNS of the LAN port



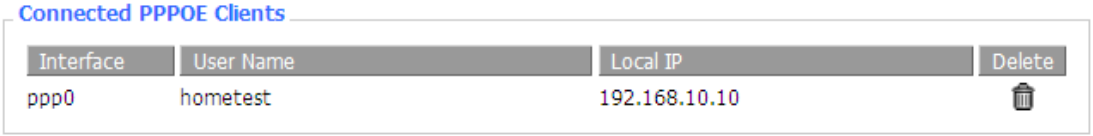
Host Name: host name of LAN client
IP Address: IP address of the client
MAC Address: MAC address of the client
Conn. Count: connection count caused by the client
Ratio: the ratio of 4096 connection



DNCP Server: enable or disable the Cellular Gateway work as a DHCP server
DHCP Daemon: the agreement allocated using DHCP including DNSMasq and uDHCPd
Starting IP Address: the starting IP Address of the DHCP server's Address pool
Ending IP Address: the ending IP Address of the DHCP server's Address pool
Client Lease Time: the lease time of DHCP client



Host Name: host name of LAN client
IP Address: IP address of the client
MAC Address: MAC address of the client
Expires: the expiry the client rents the IP address
Delete: click to delete DHCP client



Interface: the interface assigned by dial-up system
Username: username of PPPoE client

Local IP: IP address assigned by PPPoE client
Delete: click to delete PPPoE client

Connected L2TP Server

Interface	Local IP	Remote IP	Delete
ppp0	172.168.8.2	172.168.8.1	

Interface: the interface assigned by dial-up system
Local IP: tunnel IP address of local L2TP
Remote IP: tunnel IP address of L2TP server
Delete: click to disconnect L2TP

Connected L2TP Clients

Interface	User Name	Local IP	Remote IP	Delete
ppp1	hometest	192.168.50.2	120.42.46.98	

Interface: the interface assigned by dial-up system
Username: username of the client
Local IP: tunnel IP address of L2TP client
Remote IP: IP address of L2TP client
Delete: click to delete L2TP client

Connected PPTP Server

Interface	Local IP	Remote IP	Delete
ppp0	172.168.8.2	172.168.8.1	

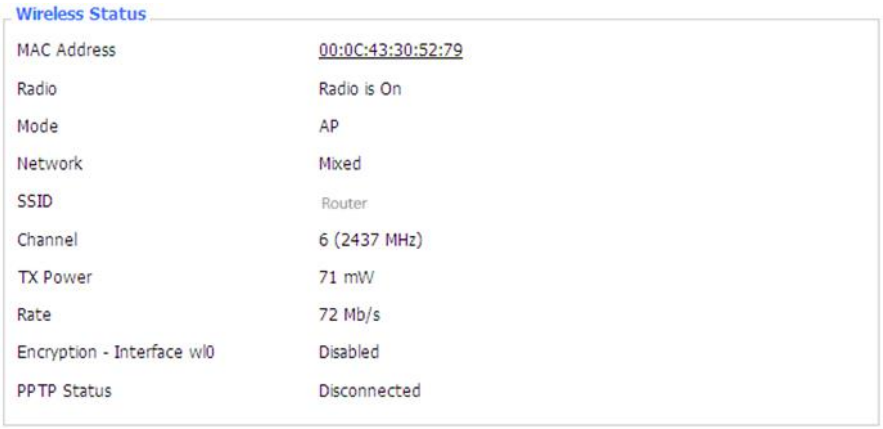
Interface: the interface assigned by dial-up system
Local IP: tunnel IP address of local PPTP
Remote IP: tunnel IP address of PPTP server
Delete: click to disconnect PPTP

Connected PPTP Clients

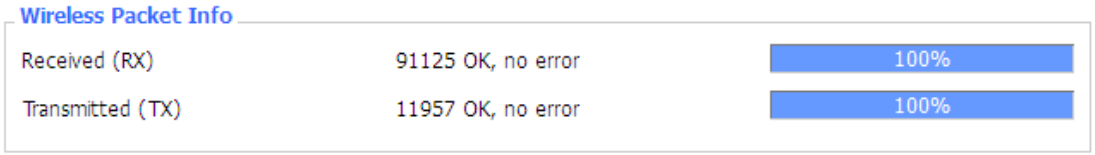
Interface	User Name	Local IP	Remote IP	Delete
ppp1	hometest	192.168.5.1	120.42.46.98	

Interface: the interface assigned by dial-up system
Username: username of the client
Local IP: tunnel IP address of PPTP client
Remote IP: IP address of PPTP client
Delete: click to delete PPTP client

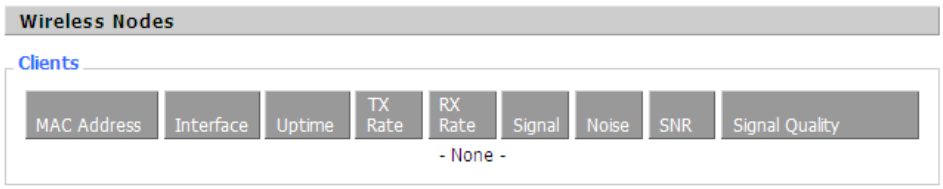
3.3.11.4 Wireless



MAC Address: MAC address of wireless client
Radio: display whether radio is on or not
Mode: wireless mode
Network: wireless network mode
SSID: wireless network name
Channel: wireless network channel
TX Power: reflection power of wireless network
Rate: reflection rate of wireless network
Encryption-Interface wl0: enable or disable Encryption-Interface wl0
PPTP Status: show wireless pptp status



Received (RX): received data packet
Transmitted (TX): transmitted data packet



MAC Address: MAC address of wireless client
Interface: interface of wireless client
Uptime: connecting uptime of wireless client
TX Rate: transmit rate of wireless client

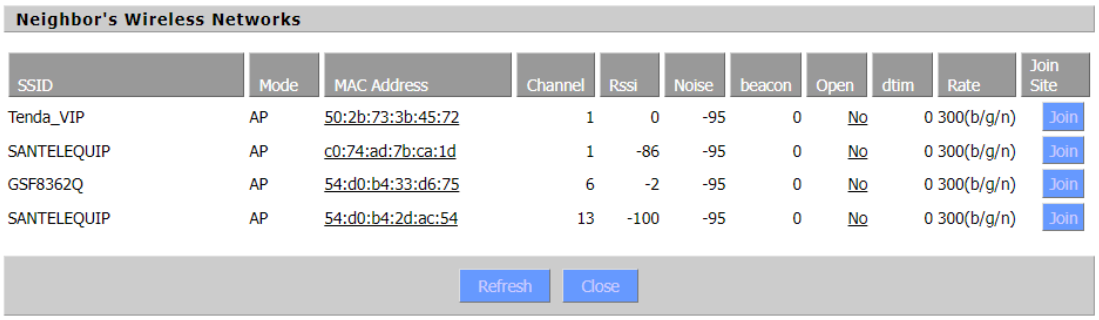
RX Rate: receive rate of wireless client

Signal: the signal of wireless client

Noise: the noise of wireless client

SNR: the signal to noise ratio of wireless client

Signal Quality: signal quality of wireless client



Neighbor's Wireless Network: display other networks nearby

SSID: the name of wireless network nearby

Mode: operating mode of wireless network nearby

MAC Address: MAC address of the wireless nearby

Channel: the channel of the wireless nearby

Rssi: signal intensity of the wireless nearby

Noise: the noise of the wireless nearby

Beacon: signal beacon of the wireless nearby

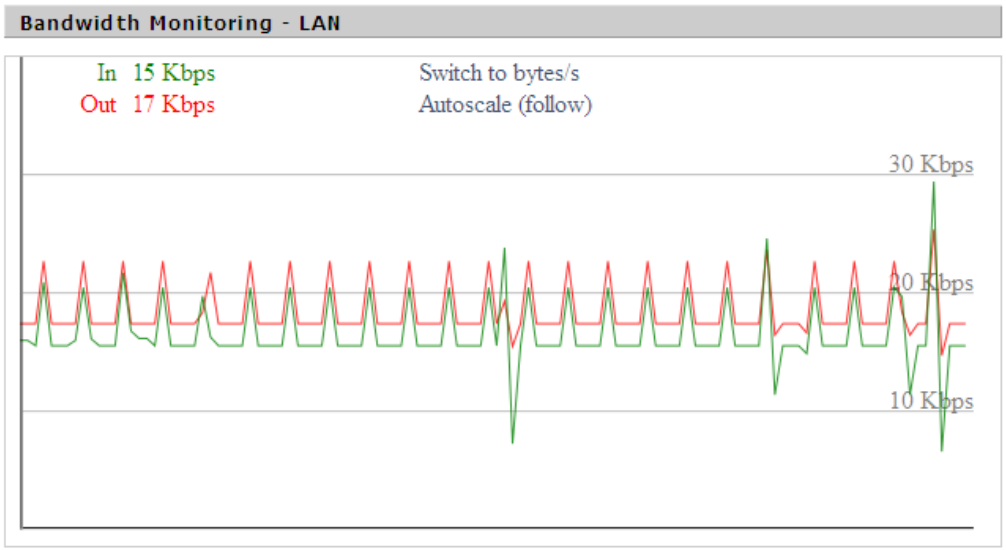
Open: the wireless nearby is open or not

Dtim: delivery traffic indication message of the wireless nearby

Rate: speed rate of the wireless nearby

Join Site: click to join wireless network nearby

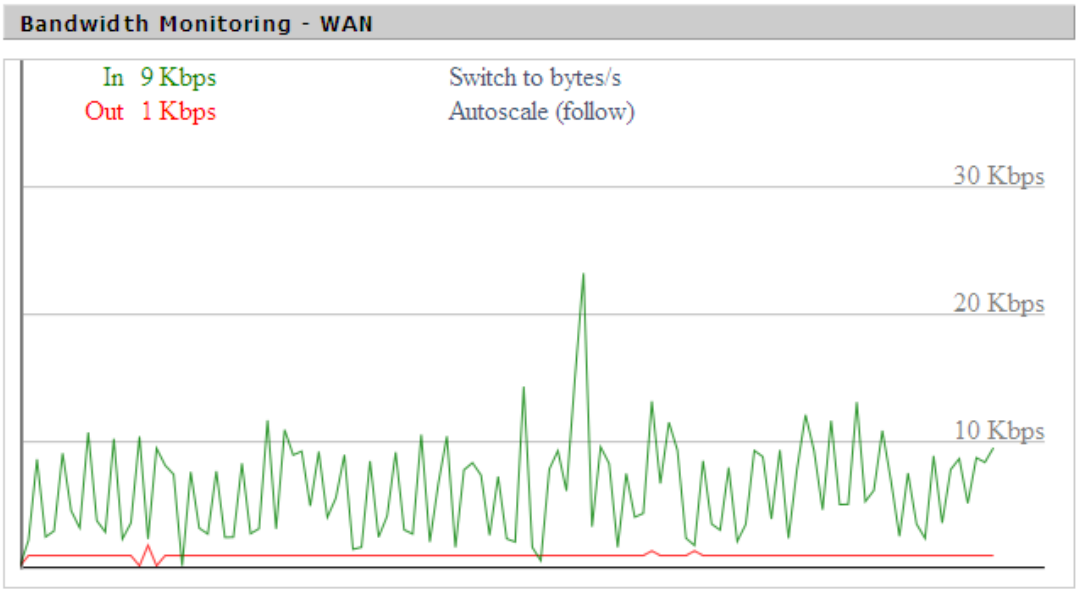
3.3.11.5 Bandwidth



Bandwidth Monitoring-LAN Graph

abscissa axis: time

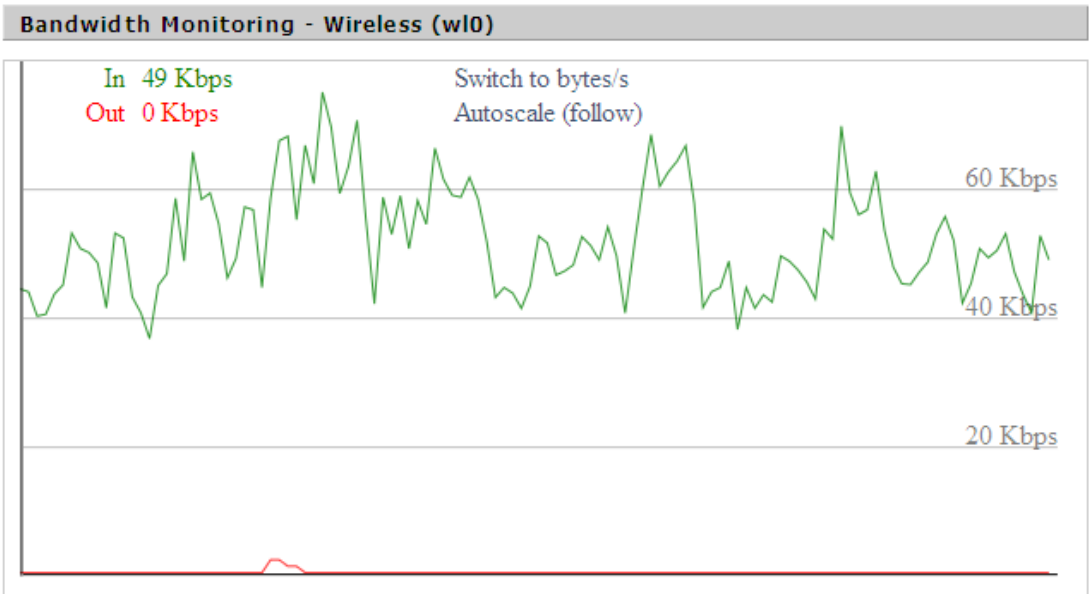
vertical axis: speed rate



Bandwidth Monitoring-WAN Graph

abscissa axis: time

vertical axis: speed rate



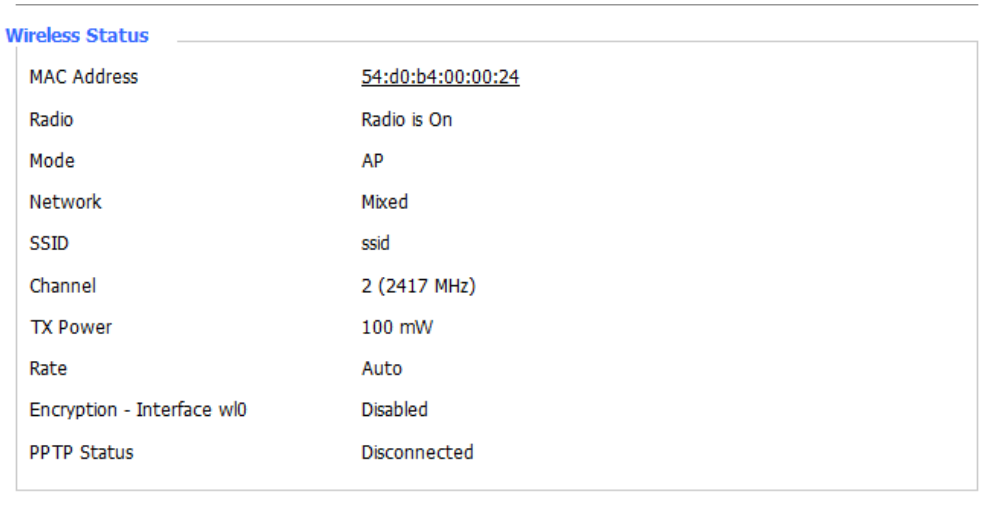
Bandwidth Monitoring-Wireless (W10) Graph

abscissa axis: time

vertical axis: speed rate

3.3.11.5 Sys-Info

Cellular Gateway Name: the name of the Cellular Gateway
Cellular Gateway Model: the model of the Cellular Gateway
LAN MAC: MAC address of LAN port
WAN MAC: MAC address of WAN port
Wireless MAC: MAC address of the wireless
WAN IP: IP address of WAN port
LAN IP: IP address of LAN port

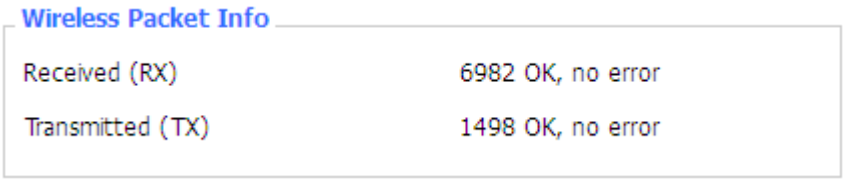


Radio: display whether radio is on or not
Mode: wireless mode
Network: wireless network mode
SSID: wireless network name

Channel: wireless network channel

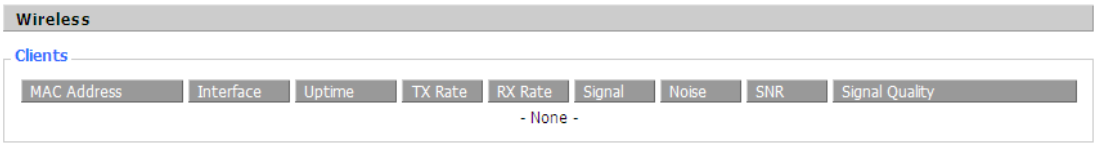
TX Power: reflection power of wireless network

Rate: reflection rate of wireless network



Received (RX): received data packet

Transmitted (TX): transmitted data packet



MAC Address: MAC address of wireless client

Interface: interface of wireless client

Uptime: connecting uptime of wireless client

TX Rate: transmit rate of wireless client

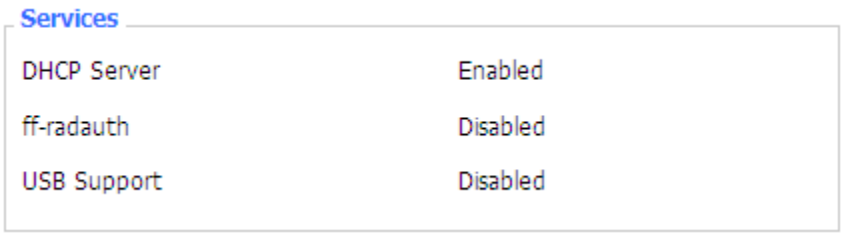
RX Rate: receive rate of wireless client

Signal: the signal of wireless client

Noise: the noise of wireless client

SNR: the signal to noise ratio of wireless client

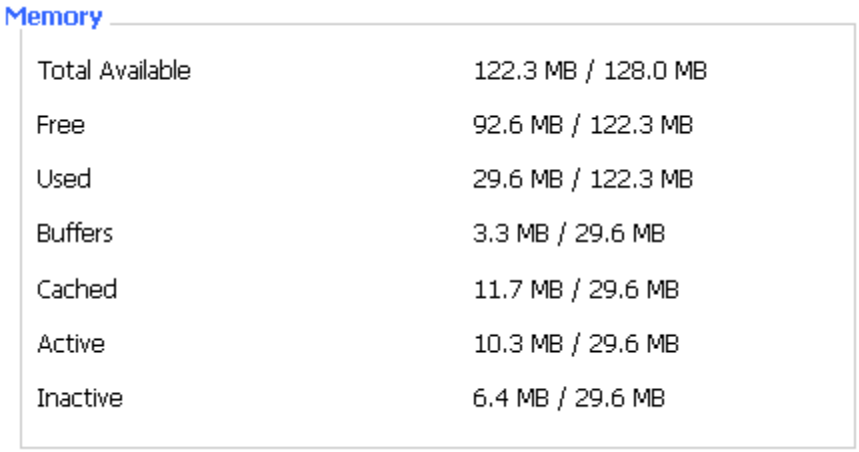
Signal Quality: signal quality of wireless client



DHCP Server: enabled or disabled

ff-radauth: enabled or disabled

USB Support: enabled or disabled



Total Available: the room for total available of RAM (that is physical memory minus some reserve and the kernel of binary code bytes)

Free: free memory, the Cellular Gateway will reboot if the memory is less than 500kB

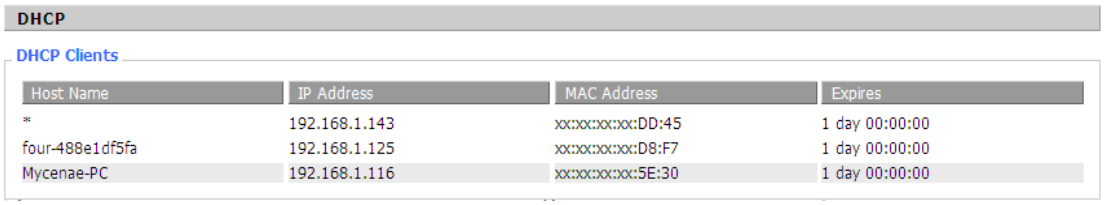
Used: used memory, total available memory minus free memory

Buffers: used memory for buffers, total available memory minus allocated memory

Cached: the memory used by high-speed cache memory

Active: Active use of buffer or cache memory page file size

Inactive: Not often used in a buffer or cache memory page file size



Host Name: host name of LAN client

IP Address: IP address of the client

MAC Address: MAC address of the client

Expires: the expiry the client rents the IP address

Chapter 4. Appendix

The following steps describe how to setup Windows XP Hyper Terminal.

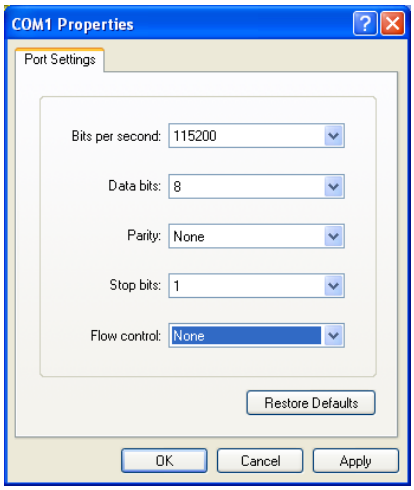
1. Press “Start”→” Programs”→” Accessories”→” Communications”→ ” Hyper Terminal”

2. Input connection name, choose “OK”

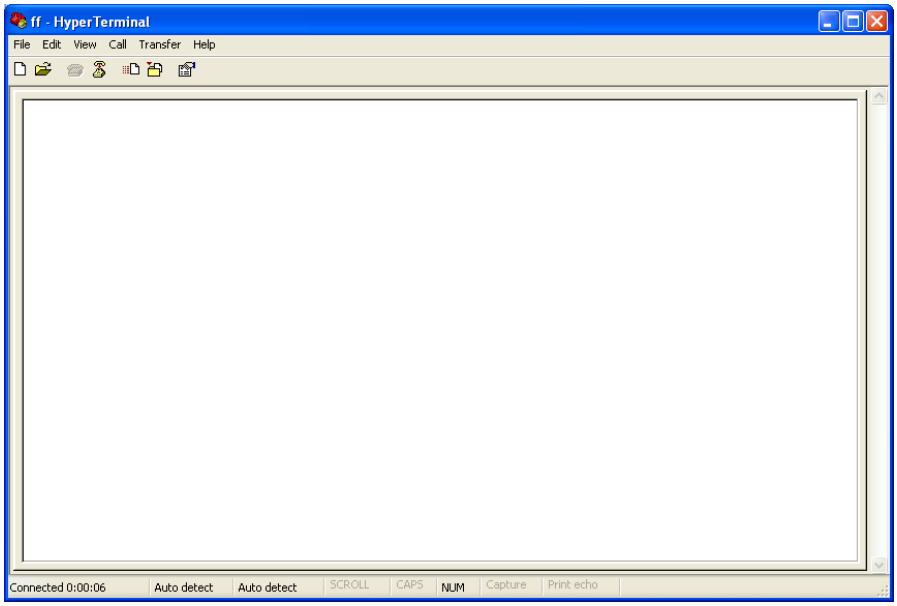
3. Choose the correct COM port which connects to modem, choose “OK”

4. Configure the serial port parameters as following, choose “OK”

Bits per second: 115200
Data bits: 8
Parity: None
Stop bits: 1
Flow control: None



5. Complete Hyper Terminal operation, it runs as following



Note: If the user is using the win7 system, you can download a win7 super terminal on the internet. Universal serial interface or other similar software.
